Known-C1 amendment v3: independent source review

Task T-1985. Review of a prospective amendment, not a run or admission. No trials, replay, compiler or cloud job executed by this review. The original v2, actual retained plan files and independent runtime-source comparison are the evidence.

Observed preservation

The complete cohort JSON equals original v2: 1,260 workloads, 22,680 execution slots, 3,780 warmups, 18,900 measured arm executions, 6,300 candidate/reference pairs and 36 pricing cells. All nine retained plan files match their recorded hashes. Seeds, arm order and original identities remain fixed.

The separate p186379 target-0 gate preserves 18 execution slots, 15 measured executions and 15 independent measured replays. Its bounds remain 25 million coefficients, 8 GiB, 3,600 seconds per execution and one new attempt. A complete valid gate and independent replay/review precede the remainder. Capped, incomplete, wrong or invalid outcomes stop extension.

Historical C1 records remain seven observed executions, four measured, eleven missing, two pencil timeouts and zero pencil solves. These are retained historical observations, not replacement successes. Earlier costs remain charged. Prior p739 rows need original-row replay or justified exact per-row mapping; their old clocks remain invalid.

Comparison and inference

V3 correctly classifies finite differences as an algorithm change, actual arithmetic/collection counts as a counter change, and CLOCK_MONOTONIC bookkeeping as an instrument change. This matches runtime-source-comparison-review-20261109/review.json. The Some/None control compares two new routes; it does not prove old/new counters equal or establish a speed result.

Derived budget arithmetic: 18 x 3,600 = 64,800 seconds before independent replay, exceeding the 43,200-second campaign ceiling. This is a product of maximum caps, not a runtime forecast. Earliest global stop must override per-execution allowance. Completion is conditional; retain unfinished outcomes without trimming the frozen sample or extending the budget.

Exact remaining bindings

Correct the unresolved relative owner-review path. Its actual source is /home/ec2-user/pencil-controller-review-20261029/c1-takeover-20261030/owner-enclosing-v2-independent-review.md, SHA256 1b17f0f85aad200feba6c8943c25e274d02578a60f26f1931a1dda8a6a38da43.

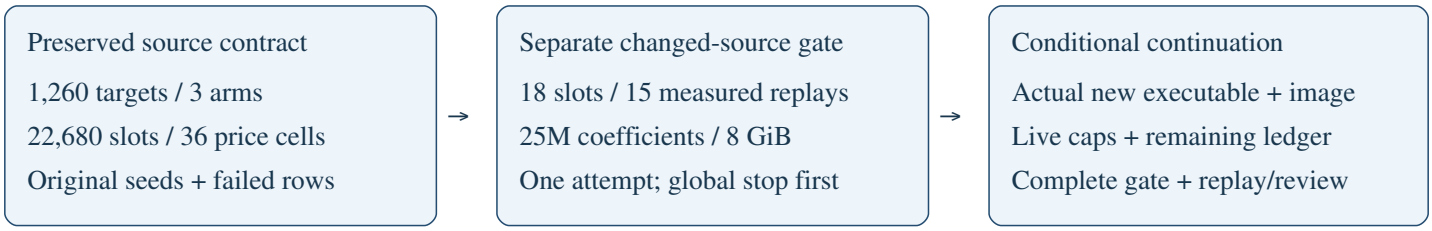
After root validation, bind the intended executable build, toolchain/features/source closure, binary and new image digest; actual runtime qualification; the already requested live CPU/RAM/namespace caps; exact owner/request/custody and deadline enforcement; latest charged/reserved ledger; complete metric and analysis/export mappings; and canonical protocol publication/freeze receipts. Preserve 04:41:39 UTC only as a proposed collection cutoff, with collection ending by 05:11:39 UTC. Remaining worker time is conditional, not the full initial allowance.

Scoped finding

Preservation and change classification are supported. The document remains draft, unfrozen and unadmitted. These are concrete artifact bindings within the existing authorized work, not requests for another permission chain. No general method ranking or performance conclusion is made. KB tools/wrapper were unavailable; exact primary repository and retained local sources supplied the review.

Additive path correction

Root corrected only the owner-review path. Independent readback confirmed the original review hash and exact equality of every other draft field. Updated amendment SHA256: 26c4866f9b9d2464b852a3e7f8b30b684985df6b8e3ce7c0b5d0ff7e8bcae17a. Finding C1 is resolved; original reviewed snapshot and finding remain retained.



Source-plan quantities, not execution results. T-1985; amendment v3; original v2 lineage retained.

Preserved plan quantities; no runtime or speed measurement.
