Actual completed norm / target curve equation
Computed support quotient U
Differentiate actual norm division
U(r) = B(r)*J(r); both target factors affine
Scaled support at q = e^2*r
U_e(q) = e^3 * B(q) * J_e
Actual quotient Q_e and remainder R_e
R_e(q) = e^3*T_e, d >= 3
PCC-20261114-af9c9e (unsigned)
Actual divisibility over K[E]
Monic base change specializes to field model
PCC-20261114-2ceac7 (unsigned)
Field e != 0: lossless replacement
T_e = 0 + four nonconstant coefficient rows
no solving-degree inference
Open: exact grading, full weighted closure
Growing-family expected bit cost
