BLINDSPOT-19: negative-results paper and Lean statements

Verdict: DELIVERED (paper item). Level: none (no exponent, constant or primitive change). Not a speed or cost result; no cross-method row, so no gap to matched rho and no GAE pricing applies.

Run: `examples/blindspots_19_checks.rs` (sha256 751277a8…8ec5), output `evidence/checks.txt`, re-run during assessment with identical output (ALL CHECKS PASS, about 0.3 s, exact integer arithmetic, no sampling, so no intervals). Host: shared 4-vCPU container, L0 isolation.

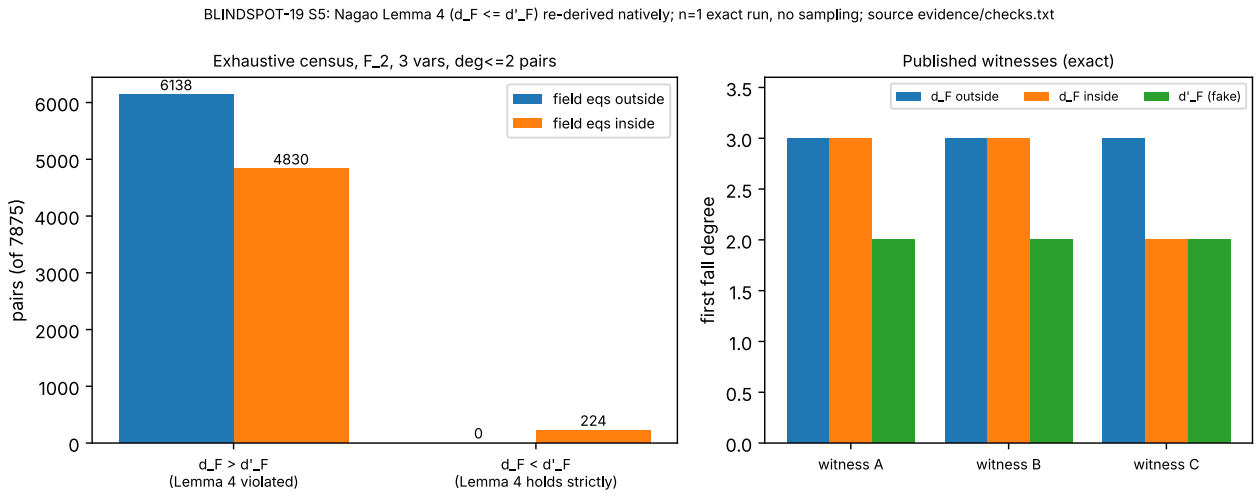

Figure 1: Recorded values from evidence/checks.txt: census of 7875 pairs and the three witnesses.

Statement labels (frozen decision rule in PROTOCOL.md)

S1	compact-orbit IC on or above S T^2 = r/|Aut|, 14 rows	RECORDED
S2	isogeny oracles add nothing in generic model; Lean core written	PROVED; Lean unchecked
S3	yield conserved: every total = C(B+m-1,m); Z/11..13 checked	PROVED, EXACT
S4	monodromy (Z/2)^(m-2)	DERIVED, UNREVIEWED
S5	Lemma 4 false over F_2: witnesses A,B,C; census 6138 outside, 4830 inside violations	EXACT
S6	Assumption 1 off diagonal	NOT ESTABLISHED

Controls passed: positive (X, X+1: d_F = d'_F = 1), negative (Z/8, Z/9 show more than one agreement; field needed), yield mirror (AP base: same total, lower coverage 7 vs 9).

Caveats

Lean modules are written, not kernel-checked (no toolchain on host); the CI proof gate is the first check. S6 demoted from the design. S1 S T line holds only at the rank-stage mean. Relabelling of existing negatives is not an improvement under the success criterion. Authors and emails owed from a human; nothing submitted.
