Rejected v1 preparation

The first B parameter set reached the direct-map base-equality preflight, which failed with `this trace has no required rational twist kernel`. No solver campaign ran on those fixtures. A trace-one anomalous fixture was also identified before measurement. The dated v2 amendment retained the original fixtures, added map eligibility and excluded trace one.

No solver observations: an execution diagram replaces a quantitative comparison.

Figure 1: Observed preparation path; no measured solver comparison exists.

Evidence: `prepared-b/b-classes.json`, `preflight-v1/base-equality.stderr`, source commit `6e30fc1de378ee764f4a63abfdd` and `AMENDMENTS.md`. The corrected 32-model base equality is in `prepared-b-v2/base-equality.json`. This is an implementation-preflight finding, not a mathematical obstruction. The original start timestamp was not separately recorded; the directory therefore gives the date without inventing a start minute.
