Declared m8 entropy charge
theta8=8H2(1/8), with 4<theta8<5
Unclamped exponent between0.4 and0.5
At its balanced base size:
whole-attack call exponent is negative
Fewer than one solve is being charged
Single-target optimistic all-output model
W=max(1,p/b^7)*c+b^2; c>=b^4
Exact model charges: W>=b^4, W*b^3>=p
For p>1,b>=1: W^2>p
No square-root gain in this declared model
Not an actual sparse-solver lower bound
Next test: actual positive-solver work,
useful independent relations and full charged cost
