Graph-find gate repair: independent controls

Positive replay x2

Find / Controls / Readback: native0, gate0, ten named readbacks each

↓

Failure propagation

Impossible theorem: Lean1 / gate1; nonexistent module: Lean1 / gate1

↓

Empty-source boundary

Empty valid module compiles0; empty required Readback also compiles0

↓

Separate inventory acceptance

Exact3modules + source hashes + ten names/allowed axioms rejects both empties

↓

Validated repair scope

Six fresh directories; unchanged bindings; helper alone is not an inventory verifier
