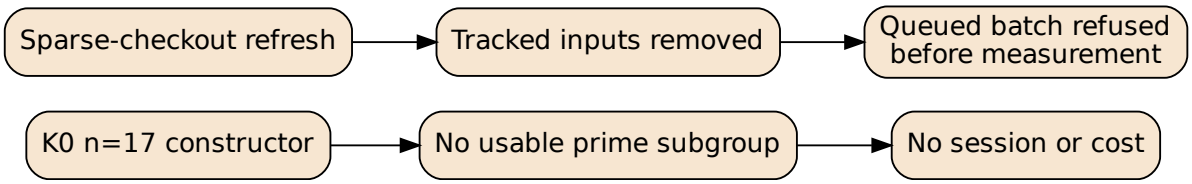
Retained complete-DLP setup refusals

The frozen structured K0 n=17 request is refused by the registered curve constructor: it has no usable prime subgroup under this constructor. No session or measured cost was produced. It does not stand for a zero-cost result or an excluded field in the mathematics.



After the n=23 replay completed, a metadata-oriented sparse-checkout refresh had removed previously force-added tracked study inputs. The queued first quartic smoke and three HKY setup commands consequently refused before native measurement. Their console logs and partial launch metadata remain in pipeline-receipts/setup-sparse-refusal-20261025 and the failed -01 directories. All required study paths were restored, and a fresh -02 batch was launched with explicit file preflight. The active frozen runner was not edited. The successful restart is a separate run, never a replacement of these refusals. No scientific verdict follows from absent input files.

Raw constructor error: evidence/checks/ic-pipeline-n17-20261025.log. Original commands and runner snapshots are in evidence/runners and the launch receipts. Full source revisions, hashes and native stdout/stderr are retained for actual measurements. These are setup outcomes, with no comparable numerical samples, so the visual is a process diagram.
