Independent source review

affine-mul-runner-20261109

Source-only; no compiler, payload or measurement executed.

1. All freeze file hashes matched;136 unique modules have exact source/import-list agreement and a valid topological order under the proposed11 external imports.26 target names retained.

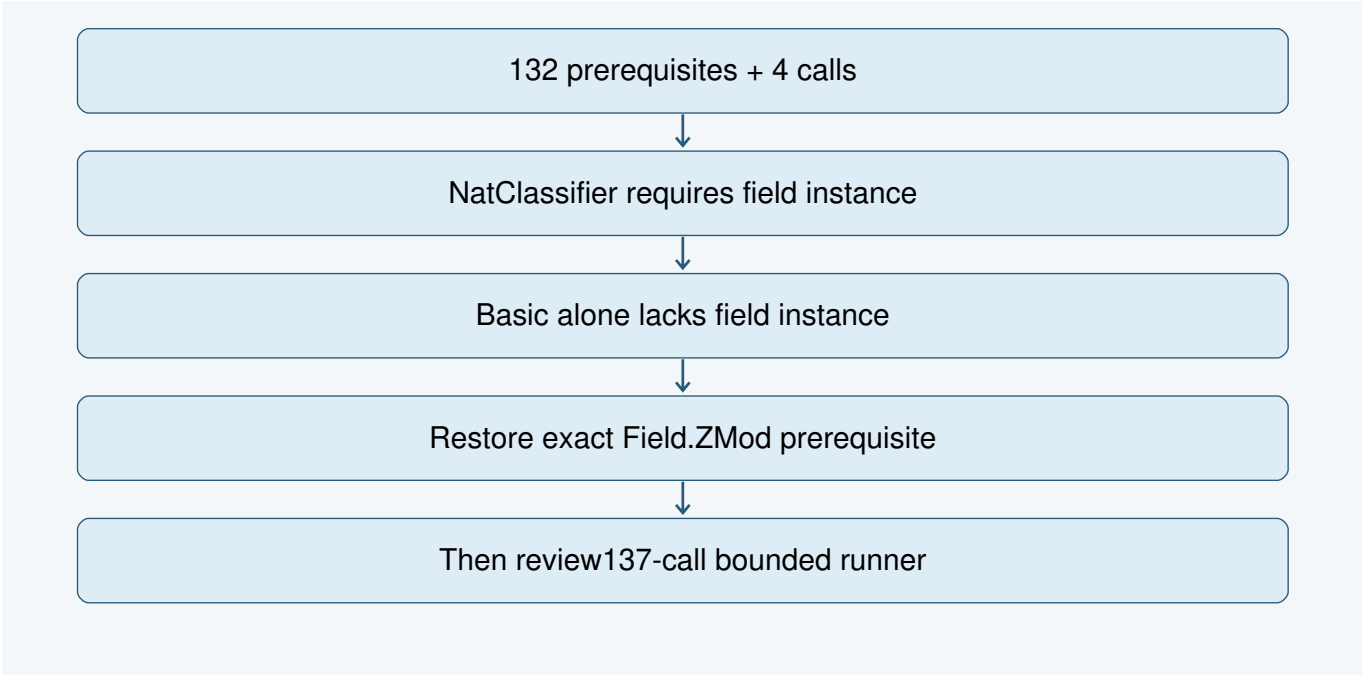
2. The runner stages source exclusively just before compilation, preserving distinct historical prerequisite selection. Positive modules reject sorry and missing artifacts; negative rejection requires a single False goal.

3. The9000-second shared compiler cap bounds136calls despite120-second per-module caps; total10800,1CPU8GiB/no swap,one attempt and inherited owner cleanup remain intact. Null ledger and false release remain prospective.

4. Finding A1: The proposed NatClassifier import replacement removes the explicit Field (ZMod p) instance provider. ZMod.Basic explicitly asserts Field absent; classifySameU22 is declared under [Field K]. The removed Mathlib.Algebra.Field.ZMod defines the required instance. Exact external transitive metadata is being checked for any incidental provider. Retain original NatClassifier import and stage/compile the exact1106-byte Field.ZMod source before NatClassifier, using actual nested module paths; its two imports are already bound. Preserve body and count the additional call.

5. The transitive .ilean metadata traversal was stopped after slow filesystem reads. No claim is made that every incidental instance path was excluded. The explicit source-level instance obligation remains unresolved by the proposed import replacement.

Argument and custody map



Remaining step: Review the corrected finite packet with the original NatClassifier import and exact field-instance source; no runtime admission is granted.

Inputs and precise hashes: review.json and snapshot/.

KB unavailable; exact retained source closure and pinned Mathlib declarations used.

Source-only review; no elaboration or payload execution.
