Helper final binding review

branch-helper-final-binding-20261109

Source-only; no compiler, payload or measurement executed.

1. The final freeze differs from the reviewed prospective freeze in exactly two fields: prior debit null to18240seconds; remaining before attempt null to24960seconds. All frozen source hashes, runtime pins, controls, five-call order and resource limits are unchanged.

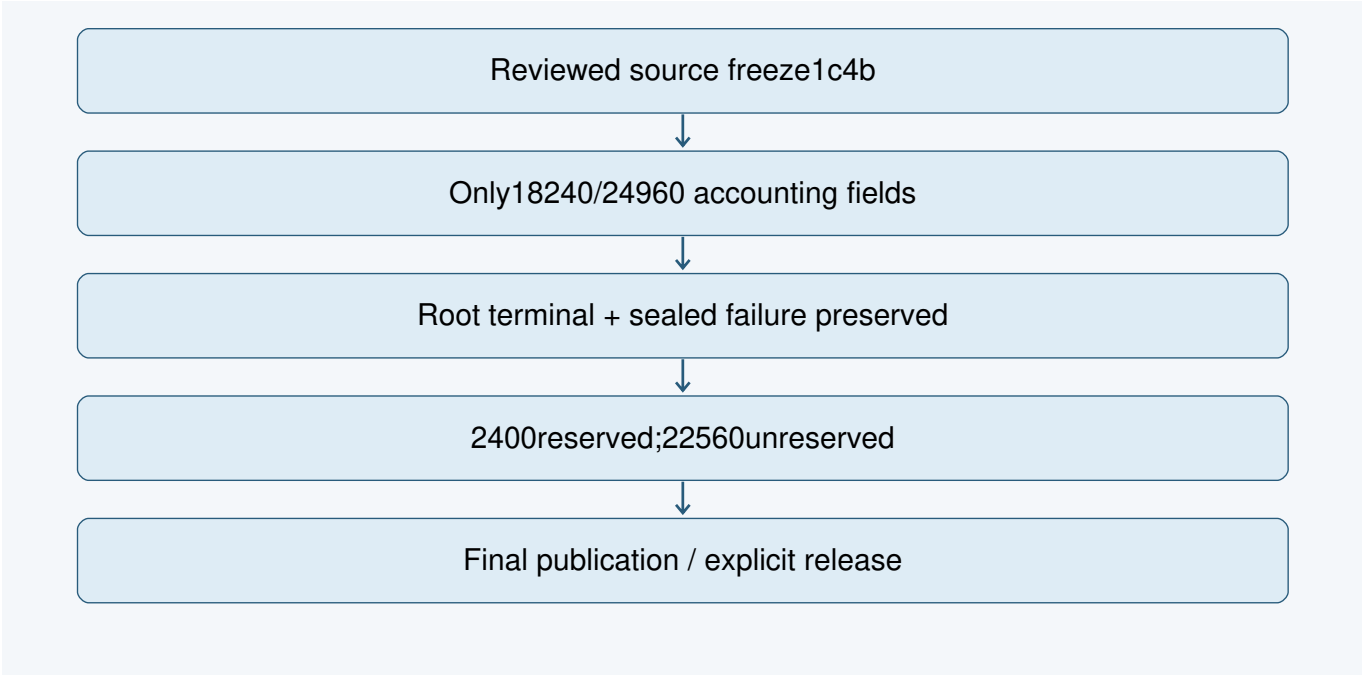
2. Current ledger reconciles43200=18240charged+2400reserved+22560unreserved. The helper reservation remains2400seconds (900pre,600compiler,900post),1CPU8GiB,no swap,one attempt.

3. Root v4 failed after reaching its full-suite phase; four exact controls passed, full suite incomplete. Completion status failed with seal passed is preserved. Its captured matching invocation has MainPID0 and absent cgroup; this is terminal custody, not a successful full-suite result.

4. Original materializer terminal/post-stop hashes and latest root terminal/completion hashes match the serial receipt. Coordinator records no overlapping payload. Helper fence T2070epoch1 matches its maintained lease readback.

5. Prior source review4409cc21 still applies to the unchanged runner. The old admission-plan remains a historical conditional plan; final-binding.json and current-ledger.json carry the actual completed-root state. The release draft is deliberately false; it is not execution admission.

Argument and custody map



Remaining step: Coordinator publishes and reads back this exact final freeze and review, binds current lease/ledger/terminal receipts into the final release, and maintains the serial owner during the single attempt.

Inputs and precise hashes: review.json and snapshot/.

Existing exact prior review, frozen source and native receipt bindings used; no new research claim.

Read-only numerical/source binding review; no payload, compiler or experimental measurement performed.
