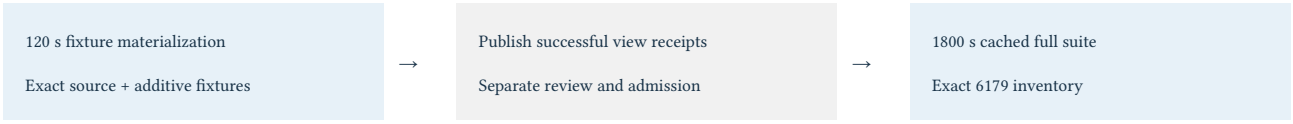
Fixture view and cached full-suite renewal

Source-only operational successor; T-2122. No materialization, compiler or test invocation.



Source-only renewal: actual prior debit and remaining allowance stay unbound until serial ledger.

Preserved construction and assertions

The native workers and launchers are byte-identical to the previously reviewed packet published at 85c96c98eba5f3d7ad85fb19d6fdf5f091d9acda. The exact 6179-name inventory, additive fixture manifest, ELF closure and previous 18 missing-fixture failure rows retain their digests. The full suite remains unfiltered, with exact passed-plus-ignored count, no failed/measured/filtered tests and unchanged ignored-name checks. No Rust rebuild is added. Runtime C++ emulator work remains charged to the suite attempt.

Operational renewal

Separate caps remain 120 seconds for materialization and 1800 seconds for the cached suite, 2 CPU / 16 GiB, zero swap, one attempt each and no automatic retry or continuation. Fresh paths and unit names isolate this successor. The campaign ceiling is 129600 seconds and deadline 2026-11-11 at 12:00 UTC. Admission now requires integer prior and remaining worker seconds summing to that ceiling; both values remain null pending the serial ledger. Queued pivot and lock-gate reservations are not assumed complete.

Pending evidence

Both admission flags are false. Publication, live ownership, preceding terminal receipts, independent renewal review and final accounting remain required. The suite separately requires published successful materialized-view receipts. No runtime result or cost ratio is reported. The prior 18 failures remain recorded; this packet does not claim they have passed. Source patches and exact provenance are retained for independent review.
