E12c: interrupted Spot continuation

Observed partial records and durable storage · 28 October 2026

One of four requested records completed for $(m, n, \ell) = (4, 28, 7)$, $N = 84$, seed 20261012. Its restricted degree-4 window was uncertified. This is an observational preservation report, not independent closure verification, a last-fall-degree lower bound, or an official hypothesis decision.

Recorded field	Value
Completed records	1 of 4; draw 0
Solutions	0, producer reported
Window certification	`false`
Degree-result fields	`d_f_window=null`; `d_f_le3=null`
Window dimension / columns	447,015 / 817,860, producer reported
Terminal state	Spot reclaim; interrupted; exit 143

Execution and interruption

The wide-variable hky_window binary ran `newcells --cells 4:28:7 --seed 20261012 --keep 4 --policies w1x`. The r7i.4xlarge Spot host in us-east-1 had 128 GiB allocated and 16 recorded threads. Producer logs record passing gates and five empty comparison diffs. The output status contains only `gate_passed`, with no final `done`; cells_status is absent. Gates were inspected, not replayed.

The log records a Spot notice at 07:21:44 UTC, exit 143, upload, then shutdown. The terminal receipt was updated at 07:22:48 UTC. Three requested completed records are missing; their individual attempt states are unknown. No resumable solver-memory checkpoint or automatic replacement is supplied by Amendment 13.

Meaning and limits

The window is a restricted subspace: reaching 1 can certify an upper bound; failure does not establish failure of the unrestricted degree-4 closure. The saved row gives no degree-at-least-5 conclusion. The frozen E12c rule needs two finished degree-4 certifications for its positive reading; this attempt has none, leaving “no reading.” No exact degree, unbounded growth, first-fall conclusion, Lean proof, performance comparison or hypothesis promotion is claimed.

Durable record and remaining checks

The 7,678-byte archive has 24 regular output files plus host.txt and rusage.txt: 26 files total. All 24 final output objects matched the archive. Original and canonical downloads passed hash checks; canonical PUT/GET and byte-comparison receipts are retained. The raw 775-byte JSONL, factor-base field basis, target, identities and terminal/snapshot/readback receipts accompany this report. These output snapshots omit the roughly 30 GB closure basis and full in-flight state; they cannot resume an interrupted closure exactly. Complete intermediate persistence remains a gap. No restart or retry is authorized here.

Formal independent experiment review, solution recount and closure replay were not performed. No schema-validated experiment.export/v1 bundle was supplied by the historical runner; this report does not claim that gate. Earlier reports and unrestricted degree plots remain unchanged. Three E12c records, E12a and the general fall-degree questions remain unfinished.
