Fixed-difference Kummer collector

KUMMER-DIFFERENTIAL-COLLECTOR-20261022

Completed targets per arm: 1260.

Uncached: 1260 source-verified, 230,430,039 quotient steps.

Uncached: 109,480,302 signed splits, 739 Recover failures.

Uncached cold ratio: 8.9597–55.9354; wins/losses: 0/36 cells.

Cold setup: 21 unique model builds, charged in all 1260 targets.

Source transfers and source verifications: 1260 each.

Every candidate and rho answer was independently checked as k·P=Q

on the original elliptic curve over Fp^2.

Rho is a same-source archived control from a separate process.

A matched-process rho gate is pending; these ratios use archived counts.

Model setup includes root search, theta search and torsion matrices.

Each cold target includes source transfer, initialization, the

quotient walk, signed Recover, graph elimination and verification.

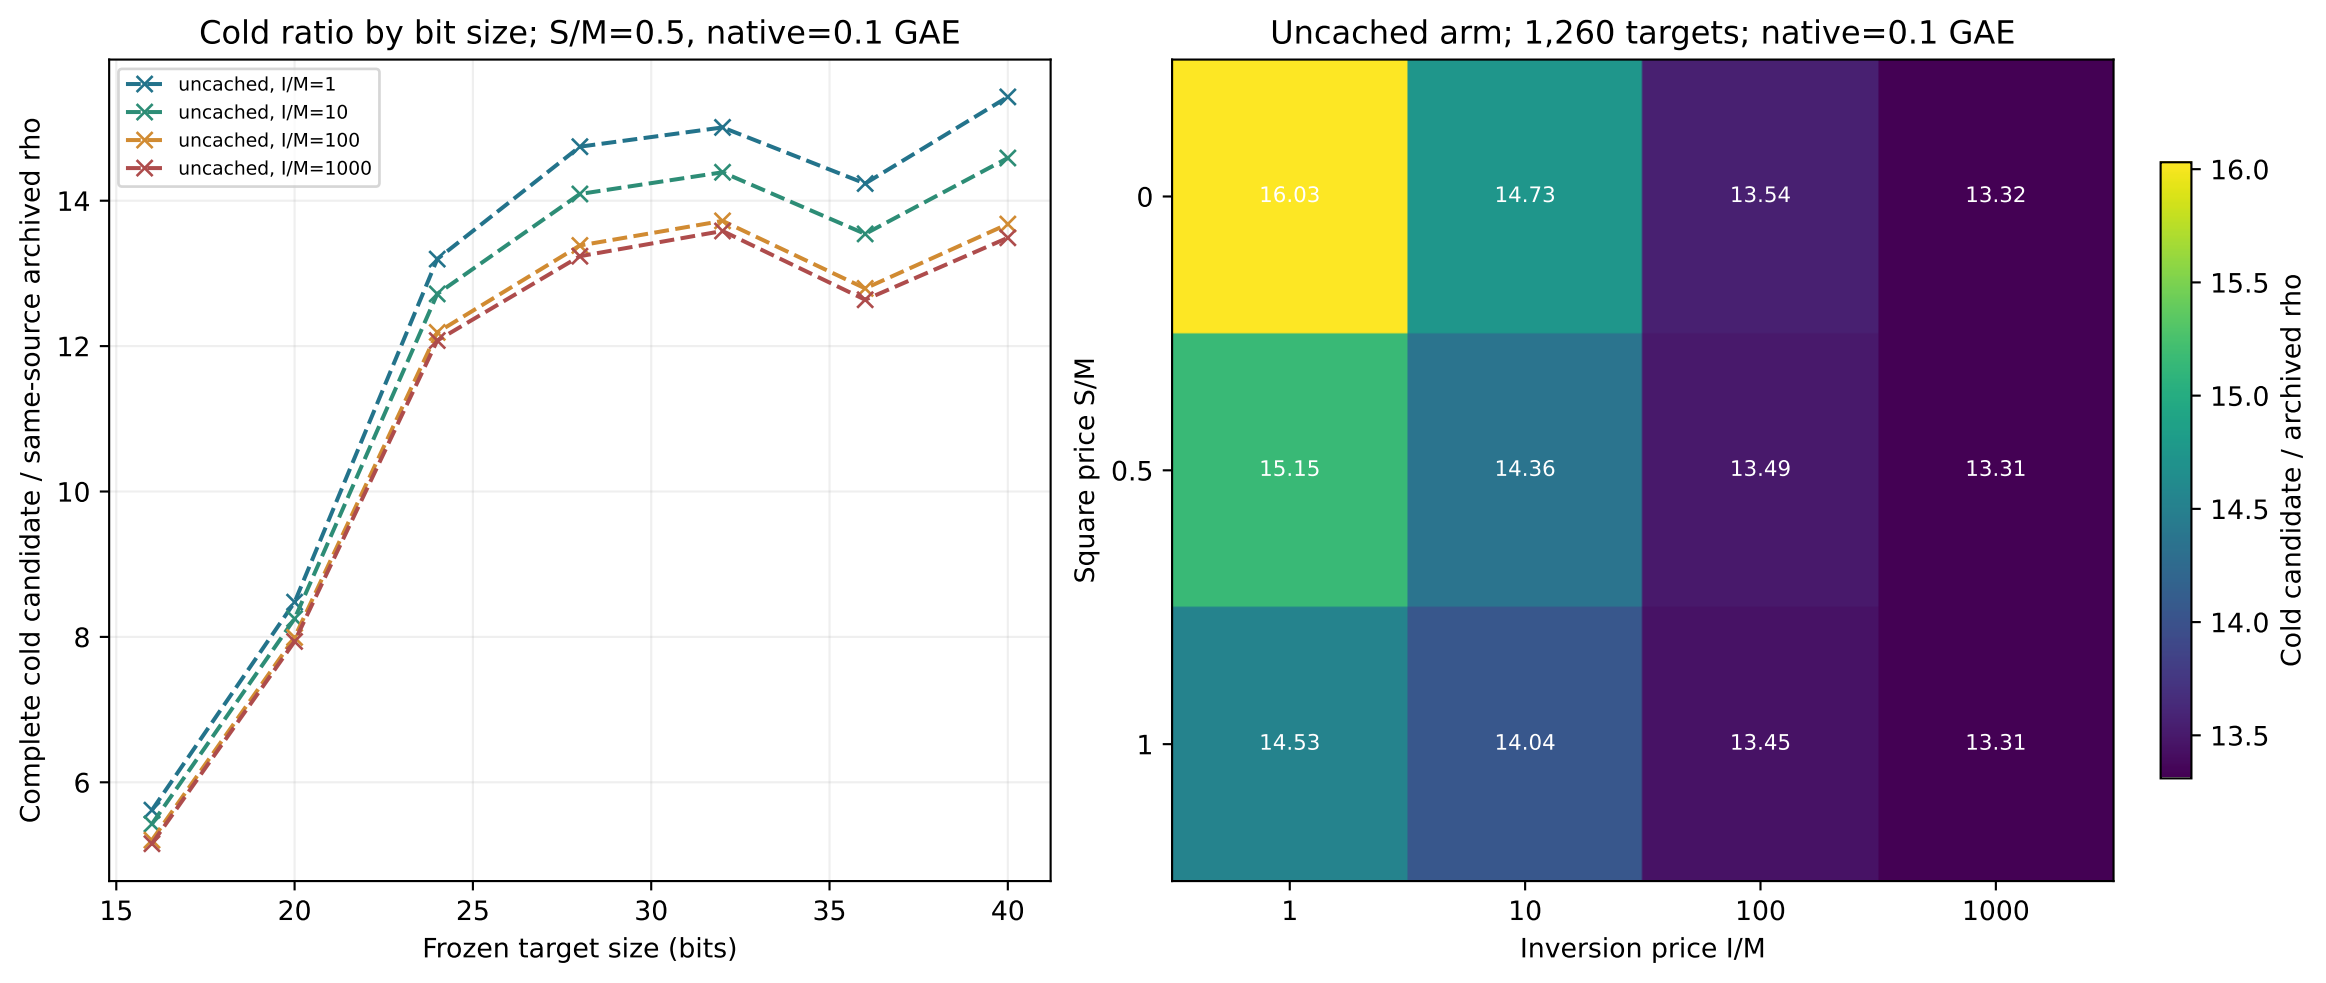
Raw: results/<arm>/collector-*.jsonl, cold-*-setup.jsonl,

results/target-price.csv and results/price-grid.csv.

All 36 cells use S/M in {0,0.5,1}, I/M in {1,10,100,1000},

and native cost in {0,0.1,1} GAE per declared logical operation.

Ratios describe this measured implementation and frozen cohort.



Cold ratio by bit size; S/M=0.5, native=0.1 GAE
