Planted input: known A, B=1, f and G over F17
This is a certificate-existence control, not a finder
Verified inverse modulo Ahat
mu(P)=coeff1(PU mod Ahat)
Moments (7,11,15,15,0)
Actual full moment form: dimension4, rank2
Actual branch restriction: dimension3, rank2
In coefficient-quadrics pencil; all cofactor tests pass
Normalize verified nonzero adjugate column
Recovered (s,t,u)=(11,5,1)
Actual norm A^2-fB^2=8G checked
Still open: general reciprocal-Hankel theorem
and a fast public-input moment/pencil finder
