Q0 image audit and Q1 transport failure

T-1467, 3 November 2026, 19:45 UTC. Owner `3f18b4ff-4e50-4f17-8bd8-924fcca3958d`.

Recorded outcome. Q0 passed its image audit. Q1 emitted a held-gate observation with PID 1, UID/GID 1000, and pids.max/pids.current both 1. Its nonce and cgroup device/inode matched the host ancestry record. Release transport then failed: Docker copy exited 1 because the container root filesystem is read-only. Q1 did not pass; no automatic retry occurred.

Recorded quantity	Value
Outer wall time (seconds)	37.834257627
Service CPU time (seconds)	8.649
Qualifier elapsed time (seconds)	5.554405689
Release-copy elapsed time (seconds, derived)	0.031484295
Completed qualification cases (count)	1 (Q0)
Conservative attempt debit (worker seconds)	600
Remaining allowance (worker seconds)	22800

Evidence. Parent-directory publication.json binds seven exact GitHub readbacks at commit be05306e7f before launch. Native receipts, image-file-inventory.json and extracted command/gate/ancestry records retain the observations. Release elapsed time is the command receipt's ended minus started monotonic time. Empty summary ancestry arrays reflect append-after-success ordering; granular records establish pre-release observations. The independent postreview accepts this distinction. There is one attempt, so the figure is a stop-point diagram, not a performance comparison.

Limits and custody. One 300-second, two-CPU, 2 GiB attempt reused the 4 GiB disk. Deadline remains 2026-11-04 06:00 UTC. All prior failures and debits remain; reservations total USD 58, actual dollars unmeasured. The worker records mounts and endpoint closed; captured observations show MainPID 0, absent cgroup and no associated loops. Bounded read-only debugfs extraction left disk metadata unchanged. The new worker disk digest is retained; the reviewer did not rehash it.

Next source step. Preserve the read-only root, one-process gate and tmpfs requirement. Review release publication through a verified directory descriptor into the existing container tmpfs, or a separately bounded owned tmpfs bind. Neither is a completed runtime correction. No scientific target was run.
