R118: exact G51 coefficient rows at x=0

5 November 2026 | 29 G51 terms | base precision 640

Factoring x=s^e U resolves three R117 unknown coefficient orders.

y0_e1: orders [-160, -127, -97, -80, 0]

y0_e3: orders [-112, -82, -61, -56, 0]

y1_e1: orders [0, 23, 23, 0, 0]

y1_e2: orders [0, 23, 23, 0, 0]

All four lower Newton edges have on-edge indices 0,8,16.

Edge slopes are 10, 7, 0, 0 respectively.

Initial polynomial: 1+T^8+T^16=(1+T+T^2)^8.

Independent schoolbook check and Lean finite claims: pass.

Repeated edge roots still require a lambda lift.
