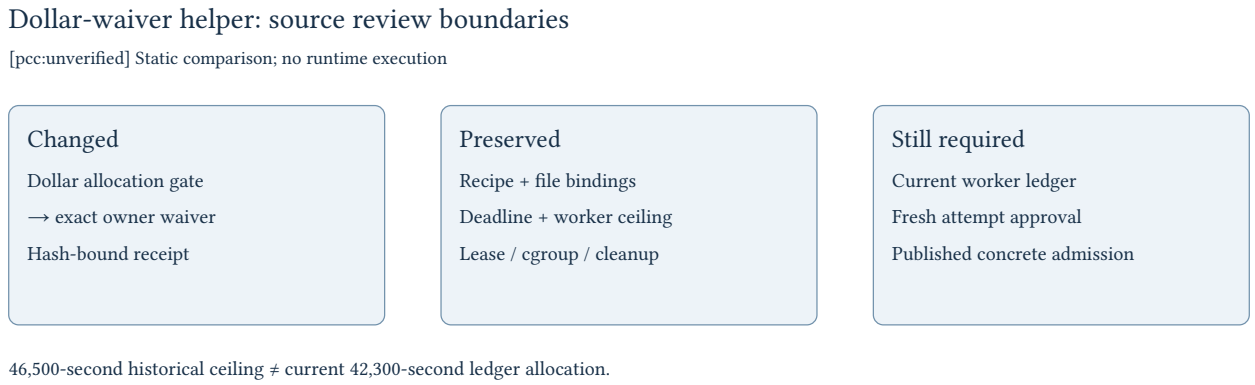
Owner dollar-waiver helper

Independent source delta review • 2026-11-05

[pcc:unverified] No new defect found in the inspected dollar-gate delta. No runtime qualification or additional attempt authorization is established.



Scope and source bindings

Candidate commit: 19415004f875e345f4f312788ed2916563c78bd3.

Candidate SHA-256: 41123bbcbc8f724c68d9bbe825dd077410a3899fd9f89f97c99b7cd458f981b1

Exact comparison is confined to load_admission. Dollar allocation checks become an exact-scope owner instruction receipt with a checked hash. Publication of proposal 714e95ca6113706f7d85739166dc8bc8e4beeaf8 was confirmed before source inspection.

Source observations

Recipe equality, file hashes, one attempt/no automatic retry, lease structure and path restrictions remain. The new fixed UTC deadline is 2026-11-06 04:00; integer worker allowance must cover the recipe and be at most 46,500 seconds.

The unchanged caller checks live lease heartbeat, invocation-bound permits, elapsed/UTC deadlines, resource containment and exact-owner cleanup. The worker retains four ordered exact tests, full suite and immutable pre/post checks. These paths were read, not executed.

Admission boundaries

The historical 46,500-second ceiling is not the current 42,300-second ledger and is not an atomic allocation. A fresh attempt needs current debit binding, explicit additional-attempt approval and concrete published configuration. Hash matching establishes receipt content, not human authority independently. Assertions require ordinary Python; the reviewed recipe does not use optimization.

The inert proposal's descriptive disabled flags are not enforcement. Its false reviewed flag, null publication and null lease do not constitute admission. No new source or runtime permission follows from this review.

Method and retained limitations

Preread plan plus exact byte/delta and caller tracing. Reviewer did not author candidate; known prior workflow context was disclosed. No compiler, test, mock, cloud or scientific execution. Full line references and observations appear in REVIEW.md, result.json and observations.csv.

Coordination note: preread plan was written after clear scope check/task creation, about ten seconds before successful claim; candidate and diff were unread. Original plan retained verbatim. KB unavailable; exact primary source used.
