Actual supplied norm + Bezout data
Witness-derived quotient functional mu
Actual entry E_ij = Ai*Aj - f*Bi*Bj
D_ij=mu(E_ij); C_j from actual residual coefficients
Exact quadratic expressions
D evaluates mu(actual norm)
C_j evaluates actual coefficient constraint
Actual matrix-pencil equality
D = sum moments_j * C_j
Canonical even chart: a=b+2, deg f<=3
Product monomial families span all bounded pairs
Family and entry degrees derived
Next: coordinate injectivity + actual branch
Witness-line intersection and corank1 recovery
Public-input finder remains separate
