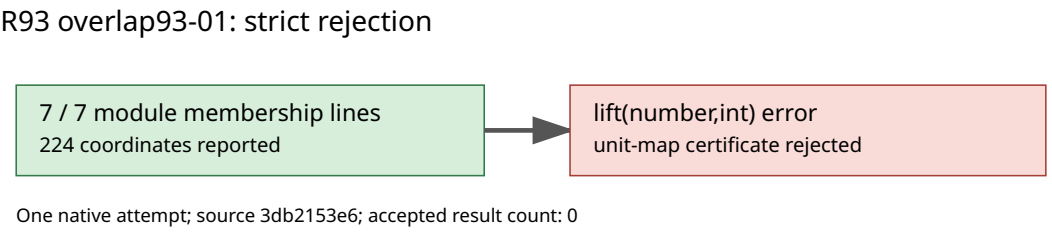
R93 principal-open overlap: rejected attempt

The frozen `overlap93-01` attempt was rejected by the strict driver. Seven of seven named functions reached polynomial rank-32 membership lines, but the coefficient inversion step called `lift` on the base-field coefficient `u`. Singular reported native errors while still exiting zero and printing a pass marker. The acceptance rule correctly rejected the result.



The next attempt will use direct `1/u` coefficient inversion in a newly frozen source. No chart-gluing claim is taken from R93. See `CM.md`, the raw native log, and the preserved source hashes.
