EXP-PFDR-ada71b break-even growth ladder v2

Run report (unsupervised rehearsal) — 2026-11-01

Experiment / hypothesis / goal	EXP-PFDR-ada71b (approved DEC-20261101-cb3277) / H-PFDR-ed7ccf / GOAL-PFDR-fd09e0
Run IDs	RUN-PFDR-a4895b selftest, 4fa30b pilot, efce3d census-main, 2d655b analyze-main, b5f267 census-rep, fe2d35 analyze-final
Status of these records	**Rehearsal, not an admitted run.** The supervisor requires the task claim to be visible in origin refs; this session cannot push (see Limits). Same plan and sources, run by hand in a scratch tree; no claim, no execution receipts; manifests record commit null.
Frozen inputs	specification sha256 51753c34e9…; trial-plan 6750eea391…; run.py, check.py, paircount.c, curve.py hashes equal trial-plan source_sha256 (verified before each run)
Recorded reading	**O-SUB-BE** (analysis.json /reading, analyze-main and analyze-final)

What ran

Six trials in plan order, each followed by its `check.py` (all `CHECK OK`). Selftest passed 126 kernel-vs-brute checks, 9 near-2^32 key checks, 6 `plant_internal` checks and 12 order certifications. Pilot: 32 curves per (rung, theta), 960 jobs, 30 cells, 40 plant entries, none infeasible, 20,151 curves planned. Census-main: 20,151 jobs, 0 failed_infrastructure. Census-rep: empty (no ALIVE line). Wall time on this 4-core Linux container: pilot 153 s, census 402 s. Pilot and census were re-run once more from scratch; `design.json` and `main-jobs.jsonl` are identical modulo `seconds` and record order.

Recorded values

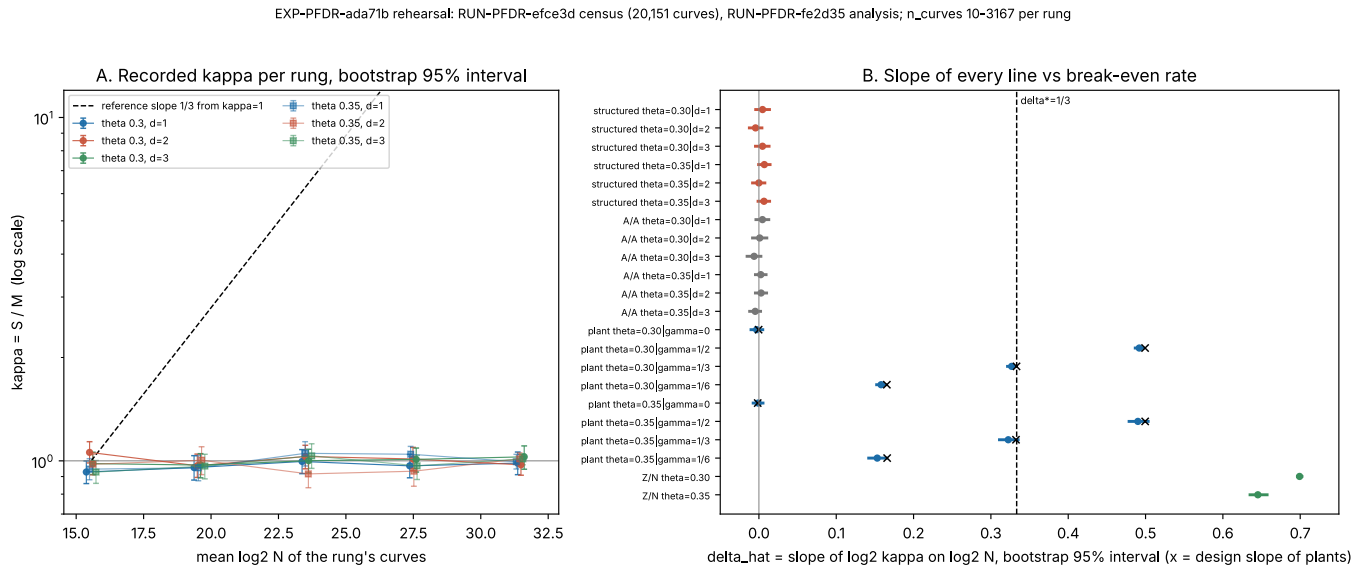

Figure 1: A: recorded kappa per rung with the bootstrap 95% interval (RUN-PFDR-efce3d, RUN-PFDR-fe2d35). B: recorded slope and interval of every line; crosses mark the plants' design slopes.

theta	d	class	delta_hat	95% interval	kappa(32) / M(16)
0.30	1	SUB-BE	+0.0047	−0.0041, +0.0136	0.985 / 3836
0.30	2	SUB-BE	−0.0044	−0.0123, +0.0039	0.974 / 3836

theta	d	class	delta_hat	95% interval	kappa(32) / M(16)
0.30	3	SUB-BE	+0.0047	−0.0044, +0.0131	1.027 / 3836
0.35	1	SUB-BE	+0.0070	−0.0004, +0.0144	0.995 / 4163
0.35	2	SUB-BE	−0.0001	−0.0082, +0.0076	1.014 / 4163
0.35	3	SUB-BE	+0.0066	−0.0011, +0.0138	1.014 / 4163

Largest recorded upper95(delta) over the six valid lines: 0.0144, against delta* = 1/3 (derived: 0.3333/0.0144 = 23.1). Recorded per-rung kappa range 0.916 to 1.058; largest recorded upper95 kappa at 32 bits 1.105. Minimum M over every rung of every line (structured, plant, Z/N, A/A) is 3670 (floor 2500).

Recorded controls

control	pass	recorded
C1	yes	selftest as above
C3	yes	plants recover design slope: |error| 0.0005 to 0.0128 (tolerance 0.03); classes gamma 0 SUB-BE, 1/6 SUB-BE-GROWING, 1/2 ALIVE at both thetas
C4	yes	Z/N delta 0.6992 (expected 0.70) and 0.6452 (expected 0.65), both ALIVE
C5	yes	six distinct A/A lines, all intervals contain 0, none ALIVE; delta_hat from −0.0062 to +0.0046
C6	yes	30 distinct z_cal: mean −0.243 (band 0.40), sd 0.899 (band 0.70 to 1.30)

Limits and missing data

- Provenance: scratch-tree rehearsal; no supervisor receipts, claim, commit binding, isolation tier or independent replay. A supervised run of the same plan should reproduce every count.
- Raw records are in `rehearsal-records/` (gzipped; large files are not meant for Git and are covered by the session checkpoint). The graph plots recorded values only; `delta_hat` and intervals are the frozen analysis' own output.
- This report states no review verdict. Reviews: `analysis/redteam_report.md` (adversarial read), `NOTE-diagnosis-and-verification.md`.
