Weighted quotient: checked $Z = 1$ specialization

For any field K, a Lean proof constructs a surjective K-algebra map from the ordinary quotient of $K[X, Y, Z]$ by $Y^2 - X^5Z - a_3X^3Z^3 - a_2X^2Z^4 - a_1XZ^5 - a_0Z^6$ to $K[x, y]/(y^2 - x^5 - a_3x^3 - a_2x^2 - a_1x - a_0)$. The map sends (X, Y, Z) to $(x, y, 1)$; $Z - 1$ lies in its kernel. The compiler exited zero and all eight theorem audits list only `propext`, `Classical.choice`, and `Quot.sound`.

The exact kernel, quotient grading, degree-zero localization isomorphism, infinity chart, and Pic^0 transfer remain open. No cost ratio changes. Source and log hashes and replay command are in `WEIGHTED_PROJ_QUOTIENT.md`; machine-readable statuses are in `weighted-proj-quotient.csv`.
