R117: G51 coefficient orders at x=0

5 November 2026 | exact marked-23 degree-7 base equation

All 29 actual G51 terms were evaluated on four base places.

Two e=1 Newton edges are certified by exact coefficient orders.

y0/e1: lambda order -10; y1/e1: lambda order 0.

Both initial edge polynomials equal (1+T+T^2)^8.

y0/e3 and y1/e2 retain exact coefficient precision gaps.

Next: extend base precision and lift repeated lambda roots.

Fresh replay, altered-source rejection, independent rational expansion: pass.

Lean finite support arithmetic: pass.

Lean checked both exact edges and the repeated polynomial.

Result SHA-256:
