Independent projective comparator review

Reviewer /root/monic_review. 2026-11-01.

Result. Six main declarations, eight producer controls and six independent controls passed fresh exact-module checks. Twenty passing named readbacks use only propext, Classical.choice and Quot.sound. No defect found in the field-vector claim.

Pivot argument. Before reading proofs, the reviewer derived the expected all-minors argument from native same. A nonzero coordinate x_i gives $y_j = (y_i/x_i)x_j$. Nonzero y then forces the scale nonzero. The producer theorem preserves both hypotheses. Raw scaled equality allows zero scale, and raw zero-vector matching is explicitly proved. Transitivity is restricted to nonzero vectors.

Independent controls. Nonunit pivot, explicit finite-sixteen Boolean acceptance/rejection, nonproportional vectors, final-coordinate pivot and zero-vector Boolean matching all pass.

Native boundary. Fin4 quantification matches the sixteen source index pairs, but no general compiled Boolean-loop theorem is present. Modular word multiplication and comparison require arithmetic decoding and canonical residue equality reflection. Raw nonzero vectors imply decoded nonzero only with canonical coordinates; a raw modulus word p decodes to zero. The native source bridge remains partial.

Retained errors. Initial replay mistakenly selected generic dependency Controls/Readback names. Its receipt is retained and excluded; exact ComparatorControls/ComparatorReadback were then checked. Initial reviewer controls used unavailable vector notation and failed; separate corrected controls use coordinate functions and pass. Failed sorryAx outputs are not passing evidence.

Workflow. Source-first prospective plan, separate reviewer, exact fresh replay and named readback completed. Plan not precommitted; full dependency rebuild, independent kernel checker, independence-validation gate and publication are separate. Cached imports remain a trust boundary. No scientific runs, producer edits or official transitions.

Binding limitation: the idempotent replay overwrote its initial input map; a subsequent fresh exact-module replay repaired this with matching final-before/final-after local snapshot maps. The superseded gap is retained.

Artifacts: REVIEW.md, status/attestation, complete receipts and logs, bindings and editable flow.svg. Next native task: canonical product equality reflection and nonzero input decoding.
