Independent residual and acceptance review

Reviewer /root/monic_review. 2026-11-01.

Checked result. Eleven main declarations, twenty producer controls and six reviewer controls passed fresh isolated checks. All 37 passing named readbacks use only propext, Classical.choice and Quot.sound. No mathematical defect found at the stated model scope.

Source-first obligations. Before reading new proof bodies, the reviewer derived residual decoding $F - V^2$ from native negation, padded addition and product. Native divisor slices motivate $|u| = d+1$, $|v| \leq d$. These shape premises combine monicity and the residual divisibility criterion with the degree requirements in Valid.

Precise theorem scope. Prime $0 < p < 2^{31}$, canonical words and sufficient residual-length fuel for completeness. Successful acceptance alone supplies soundness without a fuel lower bound. The final equivalence retains degree and stored-top guards alongside Valid; it is not an arbitrary-encoding validity test. Negation preserves list length, padded addition covers unequal lengths, and trimming preserves polynomial decoding.

Boundary controls. Exact-square cancellation, padded subtraction, degree-zero identity, degree guard failure and stored-top failure pass. A malformed shape $d = 0, u = [1], v = [1], F = [1]$ is accepted because its residual is zero; this illustrates why the external shape premise is necessary for the soundness theorem.

Retained failure. First reviewer controls used bare decide and failed to reduce the well-founded slots recursion. The failed log's sorryAx declarations are not passing evidence. A separate corrected control file unfolds defining equations before kernel evaluation; six controls and readbacks pass. Producer files were unchanged.

Native and workflow boundaries. Value-level operation order matches prime-field n=1 without diagnostic tables. Native validity does not enforce arithmetic premises. Fixed-array slice extraction, usize arithmetic, allocations, counters and compiled equivalence remain separate. The reviewer wrote a prospective local plan and used a separate snapshot; it was not precommitted and inputs were not published immutably at dispatch. Cached imported helpers remain a trust boundary. Full dependency rebuild, independent kernel checker, independence-workflow gate and coordinator publication are not completed here.

Artifacts: REVIEW.md, status.json, receipts and complete logs, input hashes, editable flow.svg. No scientific runs or official transitions were made.
