Jumps in G only: rho v6 and signed-Frobenius v5

2026-11-07

Jumps in G only: rho v6 and signed-Frobenius v5

Result (measured, counted GAE, local L0 host) [pcc:unverified]. The jumps are multiples of G only; the target enters only through each walk's start. This drops the Q ladder's doublings.

comparison	pairs	paired ratio [95 %]	summed GAE ratio	reading
rho.negation_v6 / v5, prime $2^{17.7–2}28$	2304	0.987 [0.960, 1.014]	1.006	unresolved
rho.plain_v6 / v5	2304	0.979 [0.953, 1.006]	—	unresolved
rho.signed_frobenius_v5 / v4, Koblitz $2^{15.4–2}32.1$	1728	**0.943 [0.921, 0.965]**	1.007	toy tier only

The local diagnostic (12,000 runs per size) had put prime v6 2.6 % under v5 at 2^17.7. This session's 2^17.7 ratio is 0.983 [0.926, 1.044]. The direction is the same, but the gain is not resolved, so no prime claim is made. On Koblitz the gain sits on the toy curves: 0.899, 0.912 and 0.944 at 2^16, 2^17 and 2^15.4. At 2^27.8 and 2^32.1 the ratios are 1.022 and 1.008, both unresolved. The summed GAE is therefore 1.007×, and v5 is claimed for small Koblitz curves only.

The bottom panel of the graph shows the per-curve ratios. Its top panel is a placeholder; the S-per-size panels are in the v5 report.
