Conditional final-build cost refresh

Task T-1572. 3 November 2026.

Preserved	USD55 shared margin + USD4 prior attempts
Conditional addition	USD2 final build / assembly / qualification / I/O
Delayed headroom	USD7.87 after proposed USD61 total
Admission	Draft only; no execution or guaranteed funds

Ordinary software evidence only. Read-only cost refresh; no resource mutations. T-1572.

T1572 captured twelve successful read-only AWS calls from 22:29:25 to 22:29:40 UTC on 3 November 2026. The existing worker role/account104186811093 was retained. Native argv, start/end times, exits and output hashes are saved. No resources, IAM, jobs or runtime state were changed. The root-held lease was renewed using its existing fence.

The main daily budget still reports USD 131.13 against USD 200, updated 19:48:04UTC; the alternate daily row reports USD 48.79, updated 19:56:27UTC. These are nonadditive readings. Monthly spend remains USD 350.379 against USD 1000, updated 19:56:13UTC. Fresh API observation did not produce fresh billing data. AWS documentation says budgets update up to three times per day, typically8-12hours apart. LastUpdatedTime is not a completeness watermark.

The observed Ohio footprint contains four instances, three running and one stopped; three active Spot requests;49 gp3 volumes totaling 4666 GiB;60 standard snapshots whose full logical volume sizes total 6794 GiB; one available NAT gateway; and active EKS cluster isolab, version 1.36. All volume settings are baseline 3000 IOPS/125 MiB per second. Instances, volumes, snapshots, NAT and budget rows match the prior v5 observation. One previously closed Spot request is absent from the new listing; the four remaining request records match. No billed-cost cessation is inferred from that omission. EKS control-plane status does not establish live Job/RBAC/NodePool/quota state.

Keep USD 55 shared margin and USD 4 prior attempt allocations intact. The proposed additional USD 2 comprises USD 1 final worker/mapper build, USD 0.50 private assembly, USD 0.25 private qualification and USD 0.25 retained storage/transfer. This would reserve USD 61 total, leaving USD 7.87 against delayed daily headroom and USD 588.621 against delayed monthly headroom. The additional USD 2 does not come out of the55 margin. The200daily envelope is the prior root-provided campaign assumption; the observed budget limit itself is not new spending authority or a relaxation of owner controls.

Current active request caps total USD 1.77664/hour. Fresh Ohio catalog reads show the full m8i.8xlarge host at USD 1.69344/hour and baseline gp3 at USD 0.08/GB-month. Using720hours/month, current gp3 is USD 0.518444/hour. A carried USD 0.05/GB-month snapshot planning assumption applied to full logical volumes gives USD 0.471806/hour; the regional snapshot SKU was not newly queried and actual incremental billed bytes are not measured. EKS version-support allowance is USD 0.60/hour, with provisioned-control-plane extras unmeasured. NAT hourly allowance is USD 0.045; bytes are separate.

Extrapolating this current standing footprint from the stale daily update to the 06:00 UTC deadline gives USD 34.797185, leaving USD 20.202815 within the preserved55 margin. This is an estimate, not reconstructed accrued billing or evidence that the footprint stayed constant. Other-region activity, future team commitments, S3, transfer, NATbytes, publicIPv4, CPUcredits, provisioned EKS extras and other services are not fully inventoried. No accountwide reservation census is supplied. Root confirms that this team launched no new paid resource or scientific job since the prior allocation: only bounded source/proof checks on the existing host and artifact I/O. Earlier setup overhead remains unknown. Root also reports an approximately 22:23 UTC IsoLab overview with a succeeded hashed-ecdl-cpu-round24 Job and a suspended pending sat-hpo-metal Job, and no pencil Job. That parent-reported observation is scoped and was not rerun here.

Prospective stage bounds remain one 1200-second final build at2CPU/8GiB, one 600-second assembly at2CPU/2GiB and one 300-second qualification at2CPU/2GiB, with no automatic retries and no newly provisioned resource. Full-host catalog charges are USD 0.56448, USD 0.28224 and USD 0.14112 respectively. Storage/transfer needs a concrete byte envelope before runtime release. These conservative attempt allowances overlap the standing footprint; they are not claimed as disjoint billing.

The separate ordinary root source check has a proposed 1800-second/2CPU/16GiB bound, full-host catalog equivalent USD 0.84672. It uses the existing host already represented in the55 margin estimate. This packet infers no scientific worker debit or source-check execution release. Existing scientific remaining 22200 seconds and 06:00 deadline are unchanged.

Conditional allocation remains a draft for root and independent review. Required before any launch: exact wrapper and aggregate resource enforcement, source/binary/protocol/image bindings, live ownership/job reconciliation, root confirmation of competing commitments, and an explicit finite allocation decision. Unknown funds are not guaranteed by stale

headroom. execution_admitted and allocation_approved remain false. References and raw receipts are retained; historical reservations and attempts are unchanged.
