Weighted law: global class bridge reconciliation

T-1535 | retained source/evidence inspection | no new proof execution

The weighted-Proj charts, properness, global smoothness and actual infinity DVR already exist. Later sources also close the two-chart isomorphism and specialize branch zero orders to the actual quintic. These components should be reused.

Existing actual geometry

Charts / properness / smoothness / infinity DVR

Existing local orders

Branch actual-quintic order; rational nonbranch and derivative DVRs

Next concrete composition

Actual-quintic nonbranch norm identity and zero order in one stalk

Later global construction

Common function field -> all places -> principal divisor -> class sum

Proposed theorem: for the actual quintic and a rational nonbranch point with n(x0)=b*y0, derive the actual point DVR, scalar units, numerator nonunit and mapped source norm identity. Then apply point_norm_order to obtain the sum of support valuations. Do not assume those local conclusions as free interface arguments.

The selection condition matters: norm zero can select the conjugate factor. Derive n(x0)=b*y0 from interpolation for input-support corollaries. Use one affine-to-localization-to-projective-stalk map for every polynomial and coordinate.

Global work still needs a single function field, finite zero multiplicities at all closed points, compatible infinity pole6 versus5, concrete Mumford divisors and the principal-class quotient. Rational points alone do not cover closed points over a finite field. Source exceptional branches and sequential additions retain their own obligations.

Evidence distinction: saved direct axiom logs were inspected for later cross-chart and local-order developments. Properness/smoothness/infinityDVR sources match later saved build narratives. No distinct-author geometry fidelity review was located. No fresh compilation or cohort was performed.

NEXT.md gives exact real types/maps and a proposed, unapproved120-second source validation envelope after dependency custody. CSV and JSON separate existing evidence from proposed and global obligations. Historical1,260-target cohorts and matched-rho records remain unchanged.
