R112: first blowup of the x=0 repeated edge

5 November 2026 | exact marked-23 degree-7 base equation

Set y=1+x(1+w); divide f51 by x^3.

The 24-term quotient has special fiber w^3.

Its lower hull: (0,7), (1,2), (3,0), (7,4).

Slope 5 residual 1+w is simple.

Slope 1 residual 1+w^2=(1+w)^2 remains repeated.

Next: lift the simple root and blow up w=x(1+w1).

Fresh replay, altered-source rejection, independent substitution: pass.

Lean finite edge arithmetic: pass.

Normalized branches and N51 valuations remain to be determined.
