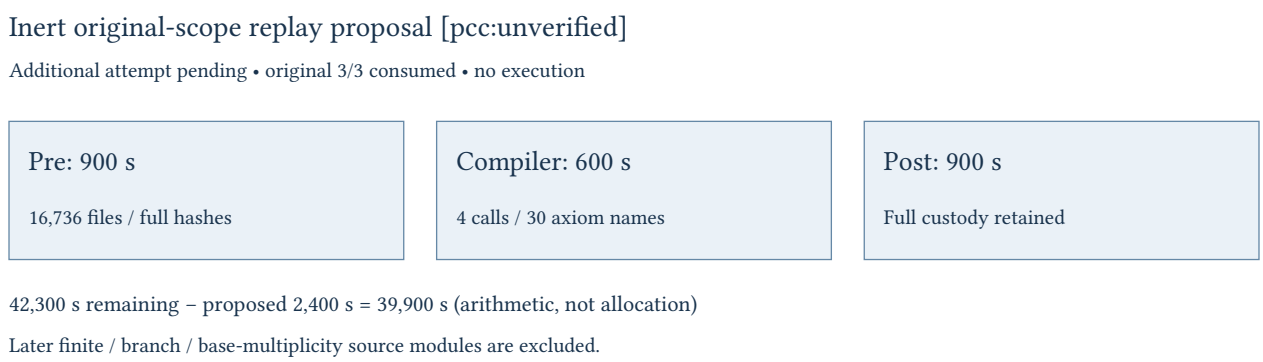
Inert additional nonbranch replay

[pcc:unverified] Concrete source proposal; no execution or renewed attempt permission.



Preserved work and correction

The original three attempts remain consumed. V3 completed full pre/post custody; Nonbranch compiled, IndependentControls failed. Named readback and the expected negative case were not reached. This proposal changes only the control proof source to published correction 7863b3ea2c, reviewed independently at source scope in 0b891fc25e. It remains uncompiled.

Exact scope

Retain fresh full closure checks (16,736 files, 3,111,892,318 bytes), all runtime pins, four ordered Lean calls, thirty exact axiom names, parser rejection controls and the intended negative failure. Compiler failure still requires post-custody when owned termination and remaining time permit. No automatic retry. One CPU, 8 GiB RAM, zero swap and 128 tasks remain.

Gates and accounting

Both Python entrypoints stop unconditionally before side effects. Runtime lease, publication receipt and approval are null or false. A separately approved, published and reviewed successor must bind fresh admission and current ownership; do not toggle the frozen draft. Deadline remains 2026-11-06 04:00 UTC. Campaign ceiling 46,800 seconds, conservative prior debits 4,500, remaining 42,300. A proposed 2,400-second attempt leaves 39,900 arithmetically, without allocating this or other proposed work. Dollar waiver does not renew non-dollar limits.

Explicit exclusions

The later finite-nonbranch-order, branch-point-norm, branch-norm-transport and branch-root-multiplicity packets are outside the four imported inputs and thirty named readbacks. A successful original-scope replay would not kernel-check their finite bridge, branch classifier, stalk transport or base multiplicity constructions. No infinity/global-divisor claim is added.

Evidence and method

Exact source bindings, unchanged closure/runtime references and corrected source hash appear in bindings.json and freeze.json. PLAN.md records previous results and admission obligations. No compiler, test, mock or payload ran. KB tools unavailable; primary published source and reviews used. New paths are proposed identities, not live ownership.
