Off-diagonal transition in the constructed two-chart gluing datum

Formal result packet for independent review

25 October 2026

The pinned Lean file `Common22GlueCast.lean` proves three identities about the constructed genus-2 two-chart gluing datum. Its off-diagonal overlap objects equal the separately defined affine and infinity overlap schemes. After equality casts, the datum's transition from the affine chart to the infinity chart equals the previously checked overlap transition. This is a statement about the constructed `Scheme.GlueData`; it does not identify that datum with a chosen smooth projective completion.

Gate	Status
Two off-diagonal overlap-object equalities	Checked
Affine-to-infinity transition with equality casts	Checked
Chosen smooth projective completion	Open
Infinity stalk and divisor/Pic^0 transport	Open
Production Rust-law semantics and rho cost	Open; unmeasured

The compiler receipt is in `glue-cast-build.log`; the machine-readable gate table is `glue-cast.csv`, and `glue-cast.svg` presents the same boundary. The source hash and pinned toolchain appear in `glue-cast-validation.json`. The new theorem's axiom audit reports only `propext`, `Classical.choice`, and `Quot.sound`.
