Reviewed mathematical branch components

2026-10-31T02:26:47.451025+00:00

Positive distinct-other FIELD — independently reviewed

Original validity + nonzero weights + K=0 + cancellation false + distinct support.

Derived: positive ordinate equality, nonzero branch factors, output Mumford validity.

Positive distinct-other WORD — independently reviewed

Prime 5 <= p < 2^31; canonical inputs/curve coefficients; literal outer guards.

Derived: restricted Some payload, canonical output, nonzero weights, validity.

Restricted None outside this branch is not production behavior.

Failures retained: proof errors and two producer elaboration timeouts.

Repeated-support TRIPLING FIELD — independently reviewed

Four fresh reviewer checks zero; 63 bindings verified; failed attempts retained.

Polynomial validity is not a class-sum, compiler, counter or whole-walk proof.
