Degree-two dispatch: ordered guard exclusion

Native inverse guard precedes equal-ordinate doubling

Equal arm + b=0 + s=0 → t=0 → inverse guard true

Contradiction: nested b=0 must select the point-double arm

Three theorems compiled; separate axiom readback accepted

Unit/nonunit controls and direct-call/characteristic2 boundaries checked

Two failed control imports retained; final controls exit 0

14 source-bound obligation rows distinguish existing proofs from gaps

Next payload: same-u mixed extraction from original validity

Independent review pending; costs null; no scientific run
