R111: x=0 Newton entry for the degree-112 source

5 November 2026 | exact F2 support from the marked-23 donor

The base fiber is y^4 (y+1)^3.

Near y=0: lower hull (0,2), (1,1), (4,0), (7,0).

Its positive slopes are 1 and 1/3; edge supports 1+w and 1+w^3.

Near y=1: lower hull (0,3), (3,0), (7,0).

Its slope-1 edge has residual (1+w)^3, a repeated root.

Further blowup is required before normalized branch counts.

G coefficient values here are termwise lower bounds, not valuations.

Fresh replay, altered-source rejection, independent support check: pass.

Lean finite edge factorizations: pass.
