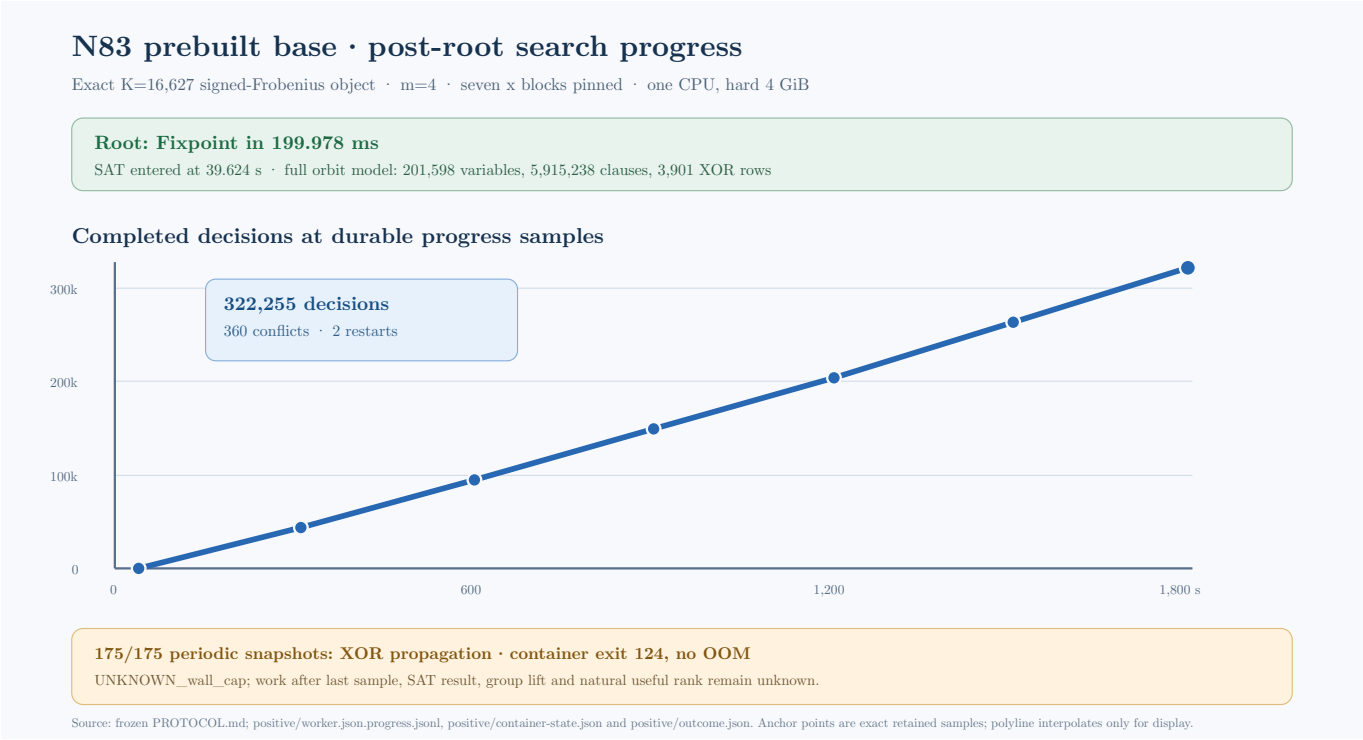
Result: N83 K = 16,627 search-progress control

Status: `UNKNOWN_wall_cap`, 2026-10-18 06:56:55–07:26:55 UTC. The stored base and seven-x-block m=4 witness passed group and model preflight. Root propagation returned `Fixpoint` in **199.977792 ms** with zero decisions or conflicts. Ordinary SAT began at 39.623697 s.



The one-CPU worker reached its 1,800-second cap: exit 124, no OOM, 2,662,309,888-byte cgroup peak. All 175 periodic samples landed in XOR propagation. The last complete sample, at 1,792.112144 s, recorded **322,255 completed decisions, 360 conflicts and two restarts**. The samples show recurrent search and XOR activity, not an exact CPU-time fraction. Later work, SAT answer, group lift and returned-relation rank remain unknown. The unpinned arm was not attempted.

This stage diagnostic selects no factor base and provides no full index- calculus cost ratio. The next discriminating run should mirror completed XOR-pass time, row scans, repivots and row operations at stable boundaries. Natural relation yield and useful rank on the retained bases remain open.
