Follow-up continuation: component evidence index

Publication inventory; neutral results and remaining boundaries

31 October 2026

Proof and software components

Word classifier	Bounded UInt 64 negation/subtraction and ordered branch correspondence compiled and independently reviewed.
Cross-scaling	Four declarations compose explicit opposite-weight arithmetic, output canonicality and the outer support guard. Independent replay and readback passed.
Word error exclusion	Producer theorem excludes the guarded zero-slope error from canonical coordinates, nonzero weights and normalized validity for the same polynomial. Independent review replayed nine modules and passed full-premise and outside-validity controls. The first reviewer control elaboration failure is retained.
Relation adapter	Three release tests and independent source review support augmented RHS to equation-constant sign conversion. It is offline; no production row capture is established.
Preflight	Private core checks report 29 tests and 8 CLI checks. Static inventory retains 1,260 workloads,22,680 cohort slots and 18 separate gate slots. Inventory completeness is not execution admission.

Kummer checks: retain the workload distinctions

Supplied-neighbour repair fixtures	Original 84 fixed cases passed repair/pair checks but had 80 exact signed recoveries and 4 conversion failures; native exit 101 retained.
Degree-one addition	Additive 84/84 exact recoveries with separately supplied anchor neighbour. Four degree-one fixtures share one distinct divisor. This component result alone did not propagate its recovery neighbour.
Four-corner torsion step	Original 252 transitions matched 1,008 corners but recovered 251 points; Delta-zero failure and exit 101 retained. Additive fallback gives 252 exact recoveries, independently replayed:243 generic,8 degree-one,1 Delta. This uses a different torsion-step state.
Original non-torsion G step	Three fixed transitions on each of 21 models per arm: selected pairs and labels match; eager 61/63 exact recoveries and candidate 63/63. Independent replay matched. This packet does not exercise successful repair or Delta-zero branches.

Interpretation and source custody

These are separate component checks with different inputs and state contracts. They must not be pooled into a success rate or presented as a new full 1,260 target cohort. Every new complete-cost ratio remains null. The bounded Delta Mumford-candidate list does not remove the existing square-root nonresidue search; full accounting remains open.

The original failure packets, additive corrections, source manifests and independent reviews are explicit entries in missing-packets.json. INDEX.md and index.json provide evidence links for the intended installed report location. The current copy script already includes eight packets; thirteen proposed additions are listed, including the now-terminal WordError independent review. Root source and files were not edited by this inventory task.

The existing seven-worker-hour planning allowance and 06:00 UTC deadline remain unchanged. Actual bindings, runtime qualification and prospective review still govern scientific execution. No cloud operation, benchmark or scientific trial was performed for this index.
