Actual unknown source point Q
No target-log label
Proposed target-dependent quartic
d t^2 = Delta_Q(lambda)
hand-derived; NOT kernel checked
Conjugate extension points R, sigma(R)
Trace R = Q; keep tangent t=0
explicit twist inverse obligation
Auxiliary twist coordinate
C = R - [h]Q; sigma(C) = -C
future relation solver
Project and deduplicate coefficient rows
Verify scalar on ORIGINAL E/P
Free fixed decorations: T determined by row
No extra useful rank from witness multiplicity
Next: coverage audit, then bounded solver comparison
Same lifted source baseline; all work charged
