Actual geometric E[2]
2 points: infinity and (0,1)
Actual mu2(F2bar)
1 point: {1}
subset of the rational image
2 differs from 4
Actual E(F2)
4 points; full geometric E[2] is rational
Original BK condition: r^2 = 4 torsion points
False here; source theorem is not refuted
Every E[2] x E[2] -> mu2
is pointwise degenerate
Set-inclusion iff fails at q=r=2, k=1
All geometric torsion rational, yet 2 does not divide 1
