Pivot proof successor: independent source review

Presentation of the root-authored sealed review, preserving its exact scope.

> Equal-row case: split i = a / i ≠ a
>
> Source derivation supported ⟶ unchanged statement and controls ⟶ native elaboration pending
>
> Five calls, seventeen names, 900/600/900-second caps retained.

The review supports the source correction in the equal-row branch: the positive case substitutes i, while the negative case simplifies the repeated guards using the inequality. The statement and hypotheses, controls and readbacks are unchanged. The scope is the Fin 4 index-swap involution and its existing downstream use; no runtime mutation equivalence is added. Five compiler calls, seventeen readback names and 900/600/900-second caps remain. Actual ledger binding and native elaboration are pending. No runtime was executed by the review. The earlier failed attempt is preserved. The reviewer recorded an initial formatting-sensitive comparison that stopped, followed by a matching comparison using the exact original newline layout. The sealed review remains unchanged. Its SHA256 is:
