Exhaustive finite arithmetic gate for the weighted genus-2 law

The test enumerates every monic reduced Mumford pair satisfying $u \mid (f - v^2)$ over each stated field for $f = x^5 + x + 2$. The curve is smooth: a common root of f and $f' = 5x^4 + 1$ would be $x = -5/2$, but $f'(-5/2) = 3141/16 \neq 0$ in either field. It compares every ordered pair with the repository's separate Cantor implementation under unit weights and non-unit weights $(2, 3), (3, 5)$. This is a finite arithmetic test. It does not establish the universal Rust-to-formula theorem, smooth projective or Picard-class transport, nor a revised collector cost.

Field	Divisors	Ordered pairs	Weighted checks	Unresolved
$\mathbb{F}_7$	66	4356	8712	0
$\mathbb{F}_{11}$	114	12996	25992	0

Branch counts. The SVG and standardized CSV record every returned branch label.

Reproduction. Schema `projective-law-exhaustive-small-field/v1`; run the command recorded in `RESULT.json`, then `python3 render.py --check`. The JSON binds the exact Rust law, independent Cantor source, and raw test log by SHA-256.
