Common 2+2 coprime-support uniqueness

`projective-law-common22-uniqueness/v1`. A pinned Lean check first proves an explicit Bezout identity: the common-branch determinant B is a linear combination of the two source-style supports. Lean also proves those supports have degree two and are nonzero. Thus $B \neq 0$ makes them coprime. Given interpolation and valid-input curve congruences, Lean proves that each support divides $H = E - B^2F$. If $\deg H < \deg(u_1u_2)$, then $H = 0$ and $E = B^2F$. A separate theorem derives this degree bound when E has degree at most six with zero sixth coefficient, F has degree at most five, their scaled coefficients match in degrees five and four, and u_1, u_2 are nonzero quadratics. These are conditional polynomial statements. Four more theorems expand a generic cubic-minus-quadratic product and read its coefficients in degrees six, five, and four. Four source-style theorems show those coefficients are $0, B^2, 0$ and equate the cubic's canonical and interpolation forms; an additional theorem proves its second-support factorization. Two further theorems prove the proof-side residual is at most sextic and obtain the strict degree bound for a monic quintic with zero fourth coefficient. A source-style theorem combines the checked interpolation, coprimeness, residues, and degree bound into the cleared curve equation under valid-input assumptions. Rust execution is not translated into Lean here.

Obligation	Recorded status
Support coprimeness from $B \neq 0$	Kernel checked, conditional
Runtime interpolation link	Open source link
First and second curve residues	Kernel checked, conditional
Generic polynomial head	Kernel checked, conditional
Proof-side source-style head	Kernel checked, conditional
Degree-bound implication	Kernel checked, conditional
Coprime low-degree implication	Kernel checked, conditional
Source-style curve equation	Kernel checked, conditional
Divisor-class conclusion	Open geometry

The CSV and JSON enumerate the obligations separately. This is a polynomial equation bridge, not a universal group-law proof. No DLP run or price changed in this packet.
