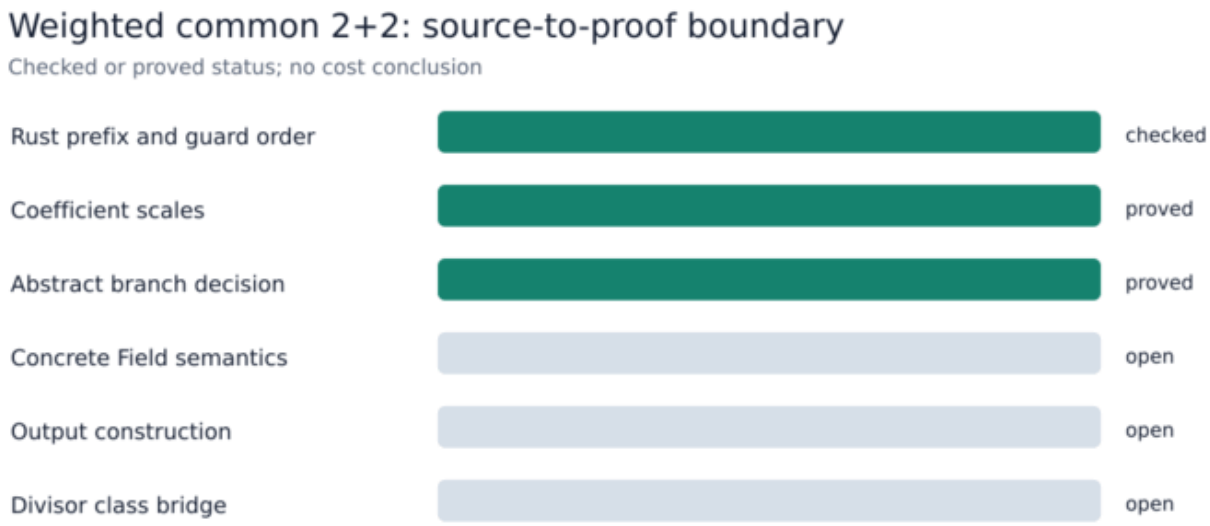
Weighted common 2+2 source prefix

The native checker matches the exact Rust statements from input destructuring through the ordered $B = 0$ and $C = 0$ returns. Mutation checks reject a changed cross input, determinant sign, and guard. The Lean model proves the coefficient scales $B \mapsto Z^8 B$, $A \mapsto Z^9 W A$, $C \mapsto Z^7 W C$ under its weighted numerator equations, and characterizes the abstract branch by nonzero B, C.



Boundary. This is a source-shape check and an algebraic theorem, not a verified compilation of Rust into Lean. Concrete `Field` semantics, output construction, and the principal-divisor/Pic^0 bridge remain open. No cost ratio changes.

Reproduction. Run the native `verify-weighted-source22` binary and compile `WeightedSource22.lean`; see the source certificate, CSV, and Lean axiom log beside this report.
