Independent add11 distinct review

31 October 2026 UTC. Scope: unit-weight field formula, normalized divisor validity and distinct-input branch selection.

Checks. All 52 producer manifest entries match. Private Add11, producer Controls, separate Readback and ReviewerControls compilations exited 0. Four non-fatal unnecessarySeqFocus warnings are retained. Axiom readback contains only propext, Classical.choice and Quot.sound.

Source correspondence. With unit weights, Rust add11 yields

$$q = -(x_1 + x_2), \quad r = x_1 x_2, \quad s = y_1 - y_2, \quad t = x_1 y_2 - x_2 y_1,$$

$$z = 1, \qquad w = x_1 - x_2.$$

Distinct x excludes both guards, which test inverse before doubling, and satisfies the source assertion. The formal output retains this field specialization.

Derivation. The support polynomial is $(X - x_1)(X - x_2)$ and $v = (sX + t)/w$ interpolates the two input values. The proof factors $v - y_i$ by $X - x_i$, transfers input support divisibility to $f - v^2$, and explicitly constructs a constant Bezout identity to combine distinct factors. It establishes nonzero weights and normalized output validity without assuming coefficient identities or the desired product divisibility.

Controls. Producer tests instantiate full validity on $X^5 - X + 1$ with points $(0, 1), (1, 1)$ and check inverse precedence, doubling and equal-x denominator. Reviewer tests add a full nonzero-slope instance on $X^5 - X + X^2$ with points $(0, 0), (1, 1)$. All compile successfully.

Classifier boundary. A reviewer control shows that invalid equal-x points $(0, 1), (0, 2)$ fall through the modeled classifier to distinct, while Rust then asserts unequal x. The theorem requires distinct x, so this is outside its premises; it prevents reading the model as a total native classifier correspondence.

Scope. No blocking discrepancy was found. An explicit prospective amendment uses degree-one support divisibility instead of an unavailable evaluation API. Native Jacobian validity refinement remains external. This is not a machine-word, generic weighted, class-sum or whole-walk theorem. No scientific run or cost measurement occurred.

Artifacts: PLAN.md, review.json, REVIEW.md, overview.svg, replay/ sources and separate native receipts/readback. Producer failures remain in the unchanged source packet.
