# First-gate infrastructure failure and executable-mode correction

2026-10-30T00:15:53Z
Public synthetic known-answer mathematical research. Evidence observations only; no judgments, new cohort executions or qualification.

Zero executions refers to this named plan-only input, not historical experiments. Per-source software scopes are distinct and counts are never pooled.

## Plan-only observations

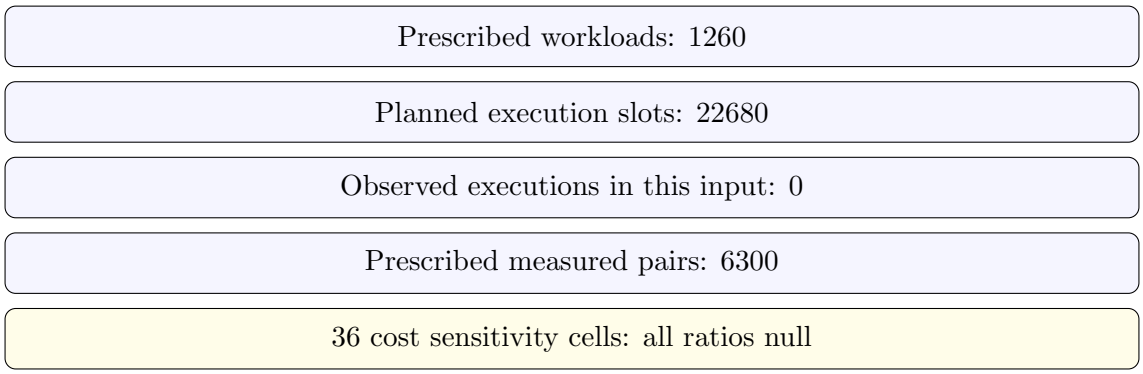

Diagram rather than a performance graph: this input contains no observed empirical ratios. Counts are read from source [plan]; no rates or uncertainty estimates are inferred. Warmup execution slots prescribed: 3780. No empirical cost ratio is available in this snapshot. Software validation and prepared inputs do not constitute independent protocol, binary, resource or launch admission.

## Scoped source observations

[**first-attempt**] Actual first gate terminated before payload spawn. This is an infrastructure failure; no mathematical target was executed and no cost ratio was measured.
checkpoint_generations: 0
error: "Permission denied (os error 13)"
mathematical_results: 0
payload_pid: null
phase: "failed"
run: "pencil-p739-20261029"
targets_executed: 0
[**mode-correction**] A new immutable image changes only the progress executable permission. File bytes and other modes are unchanged. Offline usage checks do not invoke a workload.
after_result: "Expected native Usage diagnostic before payload arguments or workload loading"
after_uid1000_exit: 1
before_uid1000_exit: 126
changed_path: "/opt/isolab/recovery/isolab-criu-progress"
file_bytes_equal: true
new_mode: "0755"
old_mode: "0700"
other_modes_equal: true
solver_executions: 0

[**independent-mode-review**] Independent receipt, recipe, inventory, image-readback and no-payload usage review. This verifies the identified permission correction, not a future controller run or mathematical result.
instrument_bytes_equal: true
recovery_verified: false
registry_digest_active: true
review_result: "pass_metadata_correction_for_identified_eacces"
scientific_qualification: false
stopped_container_never_started: true
[**retry-boundary**] Retry execution and its outcome are handled separately. This report preserves the failed attempt and records no empirical ratio from a later attempt.
new_empirical_ratio: null
new_solver_observations: 0
report_launched_retries: 0
retry_outcome: "pending separate observation"

## Evidence and limits

No software test count is an empirical target count. Missing costs stay null. Resource authorization is limited to its explicit source scope; no budget, deadline, infrastructure approval or independent review is inferred. The prior 19:06 report and its Python generator remain historical artifacts; new reports use this native renderer. [**plan**] named plan-only input; not historical experiments
