Pencil upper-size diagnostic: two exact solvers

p=186,379 · frozen target 0 · 10,000,000-coefficient cap

solver	rank	peak coeff.	row updates	index ops
Online	69672	10,011,236	1,233,576,833	0
Degree peel	84696	10,000,145	18,203,354	971,612,198

Each candidate stopped at the preregistered matrix cap.

Both same-process rho controls recovered and verified the source scalar.

Candidate scalar: null; candidate/rho cost ratio: null in both records.

The row-update reduction is a stage count for unsuccessful attempts.

The peel attempt also incurs the recorded logical index work.

These two records do not represent a solved 32-bit curve slice.

Wall time has L0 isolation because other jobs shared the host.

Raw JSONL, frozen protocol, replay and price grid accompany this PDF.
