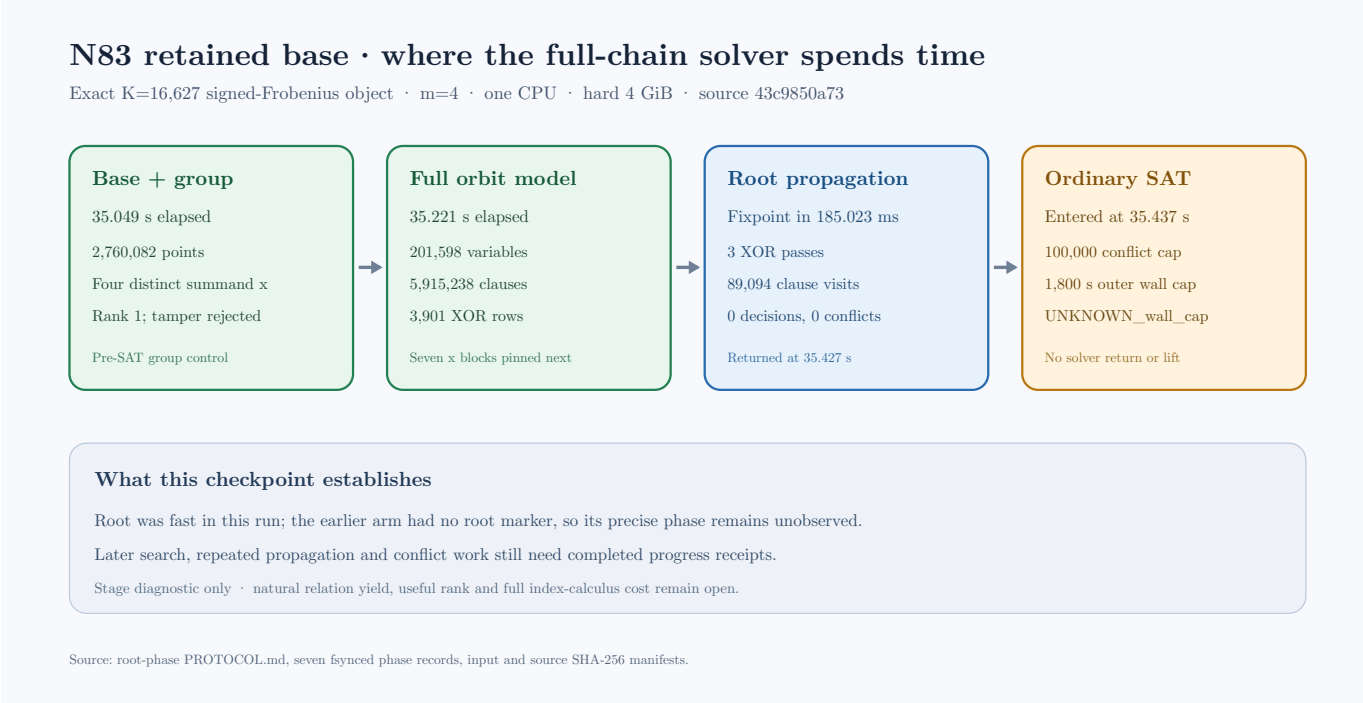
Result: N83 K = 16,627 root-phase control

Status: `UNKNOWN_wall_cap`, 2026-10-18 05:22:09–05:52:09 UTC. The exact retained signed-Frobenius object and the frozen m=4 seven-block witness passed group and model preflight. The root pass returned a `Fixpoint` in **185.023 ms** with zero decisions and conflicts. Ordinary SAT then entered at 35.437 s and did not return before the 1,800-second outer wall cap. Exit was 124, `OOMKilled=false`, and cgroup peak was 2,661,863,424 bytes. No worker result or post-SAT group lift was produced; the dependent unpinned arm was not attempted.



This is a phase diagnostic for one pinned positive control. The pre-SAT rank-one group check does not measure natural useful rank. Post-root decisions, conflicts, models and rank remain unknown. The next frozen control must retain completed search progress before trying a policy change or comparing factor-base quality. This result selects no m=2, m=3 or m=4 factor base and supplies no full index-calculus cost ratio.
