Exact sparse pivot-priority follow-up

Frozen source targets · native solver and validator · matched source rho

p=739 repeated 60-target gate: all candidate and rho scalars source verified; replay matched.

Representative cold cost: peel/rho 11.615357; Markowitz/rho 13.994822.

Markowitz/peel across 36 pricing cells: 0 lower (see full CSV for equal and higher).

Paired range: 1.000000–1.248952; 0/36 below rho.

p=186379 target 0: process complete, exit 0, failure "sparse_matrix_cap".

Upper recorded work: 95,648,928 row updates; 36,545,252,445 index ops.

Upper peak stored coefficients: 25,000,069; rank 85,463.

Candidate scalar verified: false; same-process rho verified: true.

Candidate/rho cost ratio: null.

Original cohort: 543/1260 distinct solves; 717 targets open.

This packet retains the raw failure, process exit, independent replay, all paired prices,

source checks, native validator, provenance manifest, and frozen protocol.

A repeated p=739 solve does not add a distinct original cohort target.

Wall time is an L0 diagnostic on a shared host and is not a priced field cost.

See DATA_DICTIONARY.md and results/price-grid.csv for every raw price and null.
