Pencil evidence reconciliation and planning renewal

2026-11-05 · T-1585

Preserved evidence and outstanding checks

- phase7: native pass raw missing
- root_validation: failed native cause missing
- independent_review: unexecuted
- recovered_commits: 8 ancestry verified

2026-11-05 reconciliation; historical outcomes; no new experiment or comparative timing claim.

Phase 7 has a preserved native pass receipt: controls exited 0 and deliberate failure exited 1. All three outer phases exited 0; their recorded wall durations sum to 284.045741254 seconds. Raw compiler diagnostics and parsed axiom output are missing after migration. The predecessor theorem object and dependency manifests were recovered from two hash-verified archives. This is historical receipt reconciliation, not fresh independent replay.

The root validation attempt exited 1 after 142.524373137 seconds. Its launcher reported cleanup complete, but the detailed launcher/worker receipts are missing. The failure cause, compiler invocation and tests passed remain unknown. Historical planned host overlap was USD 0.84672; actual cost remains unknown. No successful root validation is inferred.

The independent source review remains prospective and unexecuted. Its frozen source pins match; its source-fidelity conclusion remains provisional. No lead verdict is changed, and the full matched 1,260-target cohort remains incomplete.

Publication lineage

Eight previously unpublished commits are present as ancestors of recovery merge head 5e4df4a4a6. Full commit IDs and ancestry results are in result.json. PR 3237 merged at 2026-11-05 05:52:16 UTC; PR 3442 merged at 08:58:35 UTC. The recovery branch includes main and the lock/lint corrections identified by the publication reconciliation. These merge facts establish source lineage, not experiment completion.

New planning envelope

The owner explicitly confirmed 13 worker-hours total (46,800 active-worker seconds), with absolute deadline 2026-11-06 04:00:00 UTC. planning-limits.json binds the prior November 3 record by SHA-256 and leaves it unchanged. Historical failures, the prior 3,000-second debit and the prior fully assigned USD 59 reserve remain separate; none is erased or represented as fresh available funding. No new scientific worker or compiler was launched by this reconciliation.

Execution still requires completed artifact bindings, runtime qualification, prospective protocol and independent review, verified finite funds and CPU/RAM/concurrency/retry ceilings, and GitHub publication of exact source, inputs, seeds and commands. This planning record admits neither execution nor funding.

Evidence

result.json contains live GitHub observations, exact source-report hashes and commit checks. phase7-observation.json, root_validation-observation.json and review-observation.json preserve the consulted records. observations.csv supplies the editable diagram. This is a status diagram because the recorded durations belong to different tasks and do not form a comparative performance experiment. Prior failures remain recorded. Canonical research verdicts and leaderboards are unchanged.
