Attempt01: independent size-three audit rejection

2026-10-29; uniform-20261029

Producer completed all planned case files at input `7c463e834d21`; independent audit exited101, no positive receipt, no controls/backend completion. The preserved assertion was "cubic membership changes no S3 monomial." The old Rust helper incorrectly divided by the polynomial of only the first two roots for size-three bases. The invariant correctly rejected this defect. No verified comparison was admitted at this attempt. The later full replay verifies the identical producer bytes; it does not rewrite this failed run. New versioned full-base monic division was compiled/committed at `42b72c3a2feb` before the fresh second execution. No polynomial/point/state criterion was relaxed. The original failed source and full raw records remain. A quantitative comparison is omitted here because the independent result was not available at failure.

Execution contract. Same full preregistered96/896/210 workload, deterministic response census, existing local host/two workers,600s command caps, no clock or speed claim. Raw inputs/commands/exits and precise failed payload are restored by `validation/uniform-20261029/restore-runs.sh`. The official checkpoint gate passed before this scientific execution. No private key/token enters the record.

Source links. `UNIFORM_YIELD_20261025_PROTOCOL.md`, dated audit/control correction contracts, and final `reports/uniform-20261029/README.md`. The broader useful-yield/degree/source-DLP objective remains open.
