Separate-host S3 replay: both languages match

Observed result. First main-push run43501438026, job132147937956, attempt1 completed both frozen native calls. Each arm checks6prime fields,942nonsingular models and4,188,162ordered triples:244,236zero tuples,0false zeros and0missing zeros. Per-field aggregates exactly match each other and the previously seen known answer. [pcc:unverified]

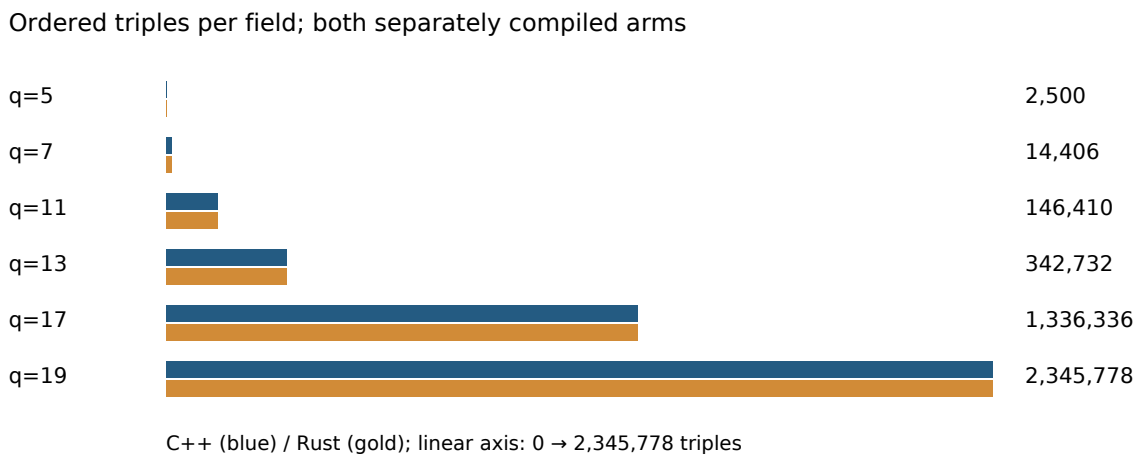

Figure. Complete output records for q=5,7,11,13,17,19 from the public hosted job. Two fresh deterministic exhaustive calls; no sampling, RNG, confidence interval or timing claim. Source: evidence/hosted/{cpp,rust}/actual.jsonl. [pcc:unverified]

Flow and budget. Planned2, attempted2, completed2, not_completed0, interrupted0, resumed0, excluded0. Standard public GitHub-hosted Ubuntu24.04runner, paid spend0, no agent artifact/cache upload, no outcome-based retries. The original manualHTTP404 remains a separate failed route; no historical execution rows imported. [pcc:unverified]

Frozen identity. Protocol3bd9bdec28e8… froze2026-11-13T19:27:20Z before the20:25:34Zrun. PR4072merged at43875b707caedfb7b8175de0961e219a1152bbb3 after required checks; both arithmetic checkouts are pinnede3658b4d6ffc6839e32bad1f5f732f796a2c8e4d. C++ uses the original byte-identical arithmetic prefix plus a fixed S3-only entry, independently implemented Rust remains unchanged. All21source/component pins match. [pcc:unverified]

Actual host and binaries. Azure hosted runner, AMD EPYC9V45, Linux7.0.0-1017-azure. C++g++13.3.0, binary612903b2b424…; Rust1.99.1, binary597621e63d47…. Complete hashes and compiler/build/run/comparison stdout/stderr/exits are retained. Both compile/run/compare exits0. Scientific clocks are invalid; native-only times, memory and isolated-core evidence are missing. [pcc:unverified]

Evidence checks. The33784-byte timestamped public log is retained exactly as retrieved, losslessly gzip archived. All24marker parts are reconstructed with explicit timestamp/separator handling; their hashes identify reconstructed files, not remote-byte attestations. Canonical experiment.export/v1 validates with verify-files and0findings against the unchanged frozen protocol. Failed extraction/export preflights are retained; no native population was rerun. [pcc:unverified]

Formal and assurance boundary. The existing11-declaration Lean quadratic-field/pair-oracle foundation and actual S3 equivalence remain linked separately. This result supplies actual separate-machine finite replication for item13. It does not prove the compilers/runtime/physical host, independence from the same author, binary characteristic, S4/S5, symbolic degrees or signed execution. Native evidence is an unsigned attestation; signed standing unverified. [pcc:unverified]

Sources and records. Pinned original Semaev/repository finite-check scope, GitHub Actions event/runner documentation and public-runner billing review are in source-review.json. Canonical export.json, protocol.json, extractor and complete raw records accompany this report. No leaderboard or performance result changes. Other fourteen-item obligations remain in the audit map. [pcc:unverified]
