Pencil online timing boundary — implementation map

Target-blind setup precedes the window. Additional adapter verification follows it.

First target validity check — First source check completed

Query / control	Decomposition	Relation checks	Elimination	Source check
validation and transfer	point-driven sieve	polynomial and Jacobian	signed graph and residual	first verification

Stages repeat as needed; query/control owns intervening bookkeeping. Five exclusive times sum to the window.

No measured durations shown; box widths are not costs. Source: timing-boundaries.csv and native_solver.rs.
