Cache inventory snapshot: receipt readback

The bounded snapshot recorded 2144 files totaling 2384062762 bytes. Independent readback recomputed these counts from the recorded inventory and verified its SHA256, 45f46580dc876e87e06d4c6382adffc8e10a6a43b1804297d89f20f70cabf04d. The changes record hash also matches the native result. This is an inventory result; it does not establish compilation or tests.

Native time was 1.735095031 seconds and outer time was 2.031036160 seconds. The full 60-second reservation is charged. Live controls recorded one CPU, one GiB memory, zero swap and 32 tasks. The compiler was not invoked.

Owner, terminal and controller receipts agree on invocation dfecd7bbe07146e893349bab73bb4d37. The terminal records MainPID zero and success; owned cleanup completed and the post-stop unit was not found. Native and caller evidence is archived with file hashes, with the inventory rather than the 2.38 GB cache payload included. No snapshot or compiler was rerun for this review.

Cache inventory: recorded observation and charge

2144 files / 2384062762 bytes

Native 1.735s / outer 2.031s / charged 60s

Inventory hashes match → owned terminal success → stopped

No compiler invocation; raw inventory archived, not cache payload

Native inventory receipt; no compiler or snapshot rerun.
